APPENDICES

Appendix A

Determination of Platelet Aggregation

Determination of Platelet aggregation

Optical platelet aggregation is a method which measures change in light transmission through stirred plasma containing platelets. As the platelets in the plasma aggregate in the presence of various reagents, light transmission through the specimen increases. The change in light transmission is recorded on graph. This method is routinely used to assess platelet function and to measure the antiplatelet effects of aspirin.

In this study, platelet aggregations in response to both arachidonic acid and ADP as aggregating agents were performed in platelet rich plasma (PRP) and PRP diluted with platelet poor plasma (PPP) to a platelet concentration of 250,000 cell/ μ l.

1. Equipments

- Plastic tubes
- Plastic pipets and glass pipets
- Automatic pipets with plastic tip
- A stop watch
- A centrifuge
- Siliconized stirred magnetics
- Siliconized glass cuvettes
- An aggregometer (Chrono-log model 560 Ca)

2. Reagents

- 2.1. 3.2% trisodium citrate dehydrate (w/v)
- 2.2. Distilled water to prepare aggregating agents.
- 2.3. Aggregating agents:

1) ADP

1.1) 10 mM ADP stock solution

Dissolved 0.01708 g ADP (sodium salt from equine muscle, Sigma chemical Co., cat no. A8146) with 4 ml. of 0.9% NSS.

Aliquots of 100 ul solution were stored in 5 ml plastic tube at -20^o C for three months.

1.2) 1000 uM ADP intermediate stock solution

Diluted 100 ul stock solution with 900 ul of 0.9% NSS to make the concentration 1 mM or 1000 uM ADP.

1.3) Working solution

Diluted 100 ul of 1000 uM ADP with 900 ul of 0.9% NSS to make the concentration of 100 uM ADP. When added 50 ul of 100 uM ADP to 450 ul PRP, final concentration in PRP (in the cuvette) were 10 uM.

2) Arachidonic acid

2.1) 100 mg/ml arachidonic acid stock solution I

Dissolved 100 mg arachidonic (sodium salt, Sigma chemical Co., cat no. A8798) with 1 ml. of distilled water. Mixed gently. Aliquots of 81.625 ul were stored in 1.5 microtube at -80^o C.

2.2) 100 mM arachidonic acid stock solution II

Diluted 81.625 ul stock solution I with 168.375 ul of distilled water to make the concentration 100 mM arachidonic acid. Aliquots of 20 ul were stored in 5 ml plastic tube at -20^o C.

2.3) Working solution

Diluted 20 ul of 100 mM arachidonic acid with 180 ul of distilled water to make the concentration of 10 uM arachidonic acid. When added 50 ul of 10 mM arachidonic acid to 450 ul PRP, final concentration in PRP (in the cuvette) were 1 mM.

3. Procedure

- 3.1. Preparation of platelet-rich plasma (PRP) and platelet-poor plasma (PPP).
 - 3.1.1. The venous blood specimen in 3.2% trisodium citrate dehydrate solution was centrifuged at 1,000 rpm for 10 minutes at 25°C.
 - 3.1.2. Carefully removed about 7 ml of supernatant PRP with plastic pipet. Stored PRP in a 13 x 100 mm. plastic tube and immediately capped it with parafilm.
 - 3.1.3. The remaining specimen were re-centrifuged at 3,000 rpm for 20 minutes at 25°C to obtain PPP.
 - 3.1.4. Removed supernatant PPP with plastic pipet. Stored in a 13 x 100 mm. plastic tube and immediately capped it with parafilm.
 - 3.1.5. Platelet count was performed on the PRP, and was adjusted to 250,000 cell/ μ l by diluting with PPP. Kept at room temperature.
 - 3.1.6. Removed 450 ml of PPP into cuvette (P/N 317) in order to use as a blank.
 - 3.1.7. Added 450 ml of PRP in cuvette in order to use as test PRP samples.

3.2 Aggregometry

- 3.2.1. Warmed up aggregometer for 15 minutes. Set temperature of aggregometer at 37°C and stirring speed to 900 rpm.
- 3.2.2. Set baseline light transmission at 90% with 500 ul PPP.
- 3.2.3. Set light transmission to 10% with 450 ul PRP.
- 3.2.4. Pre-incubated 450 ! PRP at 37°C for 2 minutes.

3.2.5 Added 50 ul of aggregating agent in PRP cuvette. Recorded continuously the change in percent light transmission (%T) continuously for 5 minutes.

3.2.6 Platelet aggregation was expressed as percent change in maximum light transmission at five minutes after adding aggregating agent.

Appendix B

Determination of Serum Thromboxane B₂ Level

Determination of Serum Thromboxane B₂ Level

Thromboxane A₂ is produced from arachidonic acid and causes irreversible platelet aggregation. TXA₂ is rapidly hydrolyzed non-enzymatically to form TXB₂. Serum TXB₂ in this study was determined by enzyme immunoassay (EIA) technique (Thromboxane B₂ EIA Kit, Cayman Chemical Co., cat no. 519031.1). This assay is based on the competition between TXB₂ and TXB₂-acetylcholinesterase (AChE) conjugate (TXB₂ tracer) for a limited number of TXB₂-specific rabbit antiserum binding sites. Because the concentration of the TXB₂ tracer is held constant while the concentration of TXB₂ varies, the amount of TXB₂ tracer that is able to bind to the rabbit antiserum will be inversely proportional to the concentration of TXB₂ in the well. This rabbit antiserum-TXB₂ (either free or tracer) complex binds to the mouse monoclonal anti-rabbit IgG that has been previously attached to the well. The plate is washed to remove any unbound reagents and then Ellman's Reagent (which contains the substrate to AChE) is added to the well. The product of this enzymatic reaction has a distinct yellow color and absorbs strongly at 412 nm. The intensity of this color, determined spectrophotometrically, is proportional to the amount of TXB₂ tracer bound to the well, which is inversely proportional to the amount of free TXB₂ present in the well during the incubation; or

$$\text{Absorbance} \propto [\text{Bound TX B}_2 \text{ Tracer}] \propto 1/[\text{TX B}_2]$$

1. Equipments

- Mouse Anti-rabbit IgG coated plate (96 wells)
- Plastic tubes
- Automatic pipets with plastic tip
- A plate reader

2. Reagents

- Thromboxane B₂ EIA antiserum
- Thromboxane B₂ AChE tracer
- Thromboxane B₂ EIA standard
- EIA Buffer
- Wash Buffer
- Tween 20
- Ellman's reagent
- Water (deionized and free of trace-organic contaminants)

3. Procedure

3.1 Preparation of Thromboxane B₂ Standard

3.1.1. Transferred 100 ul of the Tx B₂ standard into a clean test tube, then diluted with 900 ul water. The concentration of this solution (the bulk standard) was 10 ng/ml.

3.1.2 To prepare the standard for use in EIA: Obtained 8 clean test tubes and number them #1 through #8 . Aliquoted 900 ul EIA buffer to tube #1 and 500 ul EIA buffer to tube #2-8. Transferred 100 ul of the bulk standard by removing 500 ul from tube #1 and placing in tube #2; mixed thoroughly. Next, removed 500 ul from tube #2 and place it into tube #3; mixed thoroughly. Repeated the process for tubes #4-8. The concentrations of these standards were 1,000, 500, 250, 125, 62.5, 31.3, 15.6, and 7.8 pg/ml, respectively.

3.2. Performing the assay

- 3.2.1. Each plate contained 2 blanks, two non-specific binding wells (NSB), two maximum binding wells (B_0), and eight point standard curve run in duplicate.
- 3.2.2. Added 100 ul EIA buffer to Non-Specific Binding (NSB) wells. Add 50 ul EIA buffer to Maximum Binding (B_0) wells.
- 3.2.3. Added 50 ul of TxB_2 standard tube #1-8 to the standard wells (S1-S8, respectively)
- 3.2.4. Added 50 ul of sample per well.
- 3.2.5. Added 50 ul to each well except the Total Activity (TA) and the Bland (Blk) wells.
- 3.2.6. Added 50 ul to each well except the Total Activity (TA), the Non-Specific Binding (NSB), and the Blank (Blk) wells.
- 3.2.7. Covered each plate with plastic film and incubate for 18 hours at room temperature.
- 3.2.8. Rinsed the well 5 times with wash buffer.
- 3.2.9. Added 200 ul of Ellman's reagent to each well and 5 ul of tracer to the Total Activity wells.
- 3.2.10. Covered the plate with plastic film. Developed the plate in the dark on an orbital shaker for 60 minutes.
- 3.2.11. Read the plat at wavelength between 405 and 420 nm.
- 3.2.12. Calculated the assay results by a computer spreadsheet for data analysis of Cayman Chemical.

BIOGRAPHY

NAME Miss Purida Wientong
DATE OF BIRTH July 8, 1975
PLACE OF BIRTH Chiang Mai
EDUCATION 1996 B. Pharm
 Faculty of Pharmacy,
 Chiang Mai University,
 2001 M. Pharm (Clinical Pharmacy)
 Faculty of Pharmacy,
 Chiang Mai University
 2007 Ph.D. (Pharmaceutical Care)
 Faculty of Pharmaceutical Sciences,
 Chulalongkorn University
