

CHAPTER IV

RESULTS

In the present study, the Ames assay was used to determine the mutagenic activity of vegetable extract, 1-AP and beef extract. Furthermore, 1-AP or beef extract is an indirect mutagen requiring metabolic activation. When it was treated with nitrite in acid condition pH 3.0-3.5 (37°C, 4 hours), it gave rise to positive Ames mutagenicity.

4.1 Positive Controls

Nitrite Treated Beef Extract

The study of mutagenicity of nitrite treated or no treated beef extract in the absence of metabolic activation on *S. typhimurium* TA98 and TA100 (Table 4.1) showed that the higher the amount of the nitrite treated beef extract, the higher the mutagenicity index (MI) obtained from both TA98 and TA100. As a result, the 3.2-mg/plate concentration of nitrite treated beef extract was chosen as a standard for later experiments.

Table 4.1 Mutagenicity of the beef extract treated with and without nitrite in acid condition pH 3.0-3.5 without metabolic activation on *Salmonella typhimurium* TA98 and TA100.

Beef extract	Amount weight of beef residue (mg/plate)	Number of His ⁺ ^a (revertants/plate)		Mutagenicity Index (MI) ^b	
		TA98	TA100	TA98	TA100
With nitrite	0 ^c	13±4	102±5	1.00	1.00
	0.4	26±3	184±24	2.00	1.80
	0.8	60±5	214±21	4.62	2.10
	1.6	80±9	313±21	6.15	3.07
	3.2	109±26	578±88	8.38	5.67
Without nitrite	0 ^c	13±4	102±5	1.00	1.00
	0.4	12±7	104±15	0.92	1.02
	0.8	17±5	115±23	1.31	1.13
	1.6	23±8	125±20	1.77	1.23
	3.2	25±5	137±24	1.92	1.34

20 µl (TA98) or 40 µl (TA100) of 1-aminopyrene (0.0375 mg/ml) interacted with excess amount of sodium nitrite induced 578 revertants/plate or 1243 Revertants/plate respectively

^a Data are expressed as means ± SD of triplicate plates from two independent experiments (N=6).

^b Mutagenicity Index (MI) is calculated from the average value of a number of histidine revertants/plate of the beef extract divided by that of spontaneous revertants.

^c Spontaneous revertants.

4.2 Mutagenicity of Chloroform Extracts from the Vegetables

The mutagenicity of chloroform extracts from vegetables was evaluated on *S. typhimurium* TA98 (Table 4.2) and TA100 (Table 4.3). The result shows that when nitrite was added, almost all of the vegetable extracts showed mutagenicity on both strains except Pak Chee Lao, its showed mutagenic activity only on *S. typhimurium* TA100. Whereas no mutagenic activity was observed when there was no presence of nitrite, except in Pak Ka Yang at the concentration of 0.190 mg/plate on *S. typhimurium* TA98.

4.3 Mutagenicity of Ethanol Extracts of the Vegetables

The mutagenicity of ethanol extracts from vegetables was evaluated on *S. typhimurium* TA98 (Table 4.4) and TA100 (Table 4.5). The result shows that when nitrite was added, the mutagenicity index increased in direct proportion to the concentration of all vegetable extracts.

Table 4.2 Mutagenicity of the chloroform extracts of the vegetables in acid solution pH 3.0-3.5 on *S. typhimurium* TA98 (frameshift mutation) without metabolic activation.

Vegetable extracts	Amount ^a (mg/plate)	Number of His ⁺ ^b (revertants/plate)		Mutagenicity Index (MI) ^c

4.4 Antimutagenicity of the Vegetable Extracts.

Table 4.6 reveals the effects of chloroform from vegetables on the mutagenic activity of nitrite treated 1-AP and nitrited treated beef extract on *S. typhimurium* TA98 and TA100 in the absence of metabolic activation. The results show that the mutagenicity of nitrite treated 1-AP was inhibited by all of the chloroform extracts from vegetables on *S. typhimurium* TA98 and TA100. On the nitrite treated beef extract model, chloroform extracts of Pak Ka Yang and Pak Pai show antimutagenic activity. However, the chloroform extracts from Pak Chee Lao, Pak Gud and Pak Krad Hua Wan show enhanced mutagenicity on nitrite treated beef extract.

Table 4.7 reveals the effect of ethanol extracts from vegetables on the mutagenic activity of nitrite treated 1-AP and nitrite treated beef extract on *S. typhimurium* TA98 and TA100 in the absence of metabolic activation. The results show that the ethanol extracts of Pak Ka Yang and Pak Pai reduced mutagenicity of nitrite treated beef extract on *S. typhimurium* TA100. Accordingly, ethanol extracts from all vegetables showed their enhancing mutagenic effect of nitrite treated beef extract on *S. typhimurium* TA98.

Table 4.6 Effect of the chloroform extracts of the vegetables on the mutagenicity of nitrite treated 1-aminopyrene and nitrite treated beef extract on *S. typhimurium* strains TA98 and TA100.

^aAmount per plate of vegetable extract calculated on the residue.

^bData are expressed as means ± SD of triplicate plates from two experiments.

^c + or - indicates that the extract decreased or increased the mutagenicity of the model, respectively.

^d Spontaneous revertants

^e No extract was added to the standard mutagen, namely nitrite treated 1-aminopyrene(0.12 µg/plate for *Salmonella typhimurium* TA98 and 0.24 µg/plate for *Salmonella typhimurium* TA100)
