

CHAPTER 6

Suggestion for future work

Several areas of researches require more understanding of both scientific and technological aspect (i.e. processing condition etc.)

Further work should be addressed the following

1. Development work on changing the firing program may lead to improve crack free, homogeneity of powder preparation.
2. Development effort should be devoted to characterize the intrinsic properties of samples. This will be worthy of further study.
3. Work is required to develop a new processing route such as hydrothermal and consideration of comparison of electrical properties.
