กนกวรรณ เบญจนาค: องค์ประกอบทางเคมีของใบจัน. (CHEMICAL CONSTITUENTS OF *MILLETTIA ERYTHROCALYX* LEAVES) อาจารย์ที่ปรึกษา : วศ. ดร. กิตติศักดิ์ ลิขิตวิทยากรณี, 125 หน้า. ISBN : 974-17-3603-7.

จากการศึกษาองค์ประกอบทางเคมีของใบจัน สามารถแยกสารในกลุ่ม flavonoid ได้ 7 ชนิด การพิสูจน์โครงสร้างของสารทั้งหมดที่แยกได้อาศัยการวิเคราะห์เชิงสเปกตรัมของ UV, IR, MS และ NMR ร่วมกับการเบรียบเทียบข้อมูลกับสารที่ทราบโครงสร้างแล้ว พบร่วมกับสารที่แยกได้ประกอบด้วยสารใหม่ที่มีโครงสร้างในกลุ่ม furanoflavone คือ 3',5'-dimethoxy[2",3":7,8] furanoflavone และเป็นสารที่มีรายงานมาแล้ว ได้แก่ 3',4'-methylenedioxy-7-methoxy flavone, pongaglabrone, gamatin, milletenin C, millettocalyxin A และ millettocalyxin C

KEY WORD: *MILLETTIA ERYTHROCALYX*/ FLAVONOID/ FURANOFLAVONE/ FLAVONE

KANOKWAN BENCHANAK: CHEMICAL CONSTITUENTS OF *MILLETTIA ERYTHROCALYX* LEAVES. THESIS ADVISOR : ASSOC. PROF. KITTISAK LIKHITWITAYAWUID, Ph.D., 108 pp. ISBN : 974-17-3603-7.

Chemical investigation of the constituents of *Millettia erythrocalyx* leaves led to the isolation of seven flavonoid compounds. The structure determinations of these compounds were accomplished by spectroscopic analyses (UV, IR, MS and NMR) and comparison with previously reported data of known compounds. These isolates were identified as a new furanoflavone, namely 3',5'-dimethoxy[2",3":7,8]furanoflavone, and the known compounds 3',4'-methylenedioxy-7-methoxyflavone, pongaglabrone, gamatin, milletenin C, millettocalyxin A and millettocalyxin C.

## **ACKNOWLEDGEMENTS**

I am greatly indebted to my thesis advisor, Associate Professor Dr. Kittisak Likhitwitayawuid, Department of Pharmacognosy, Faculty of Pharmaceutical Sciences, Chulalongkorn University, for his excellent advice, valuable guidance and encouragement throughout my research study.

I would like to express my sincere appreciation to the National Center for Genetic Engineering and Biotechnology (BIOTEC), NSTDA, Science Park, Pathumthani, Thailand for MS and NMR measurements.

I would like to thank the Pharmaceutical Research Equipment Center of Faculty of Pharmaceutical Sciences, Chulalongkorn University for providing necessary research facilities.

I would like to thank the Graduate School of Chulalongkorn University for granting partial financial support to conduct this investigation.

I would like to thank the thesis committee for their constructive suggestions and critical review of this thesis.

I would like to express my heartfelt appreciation to Mr. Boonchoo Sritularak for his valuable guidance and kindness.

I am also grateful to my friend and all members of the Department of Pharmacognosy, Faculty of Pharmaceutical Sciences, Chulalongkorn University for their friendship, kindness support and encouragement.

Finally, I wish to thank my family for their invaluable great love, support and encouragement.

# CHAPTER I

## Introduction

The genus *Millettia* belongs to the subfamily Papilioideae of the family Leguminosae, with more than 200 species distributed in tropical Africa, Asia and Australia. Plants in this genus are well known for elaborating flavonoids and isoflavonoids.

The plants in the genus *Millettia* are trees or large shrubs, usually climbers. Leaves odd-pinnate. Flowers showy, in axillary racemes, often fascicled, simple or paniculate and terminal. Calyx campanulate; teeth generally short or nearly obsolete. Corolla much exerted; petals with long claws; standard broad; keel not beaked. Stamens monadelphous or diadelphous, filaments filiform; anthers uniform. Ovary sessile, linear, few-ovuled; style filiform, incurved, glabrous, stigma capitate. Pod linear or oblong, 1- or few-seeded, flat or turgid, late in dehiscing or hardly dehiscent (Chopra, Budhwar and Ghosh, 1965)

According to Smitinand (2001), the species of the genus *Millettia* found in Thailand are as follows.

<i>Millettia atropurpurea</i> Wall.	= <i>Collerya atropurpurea</i> (Wall.)Schott
<i>M. brandisiana</i> Kurz	กระพี้จัน Kra phi chan, จัน Chan, พีจัน Phi Chan (General); ปีจัน Pi Chan (Northern).
<i>M. caerulea</i> Baker.	ปัวเป่าเดี๋ยว Pua-po-do (Karen Mae Hong Son); ผักเยี่ยววัว Phak yiao wua (Nakhonsawan, Northern); หางไหล่แดง Hang Lai daeng (Kanchanaburi).
<i>M. decipiens</i> Prain	ป่ารี Pa ri (Malay-Narathiwat).
<i>M. extensa</i> Benth.	ก่าวเครือ Kao khruea, กวางเครือ Kwao khruea (Chiang Mai); ตานครับ Tan krop (Lampang).

<i>M. glaucescens</i> Kurz	ยะดา Ya-daa (Malay-Narathiwat); หยีน้ำ Yi nam (Peninsular).
<i>M. kangensis</i> Craib	กระเจา Kra cho, ซะเจา Kha cho, ซะเจาะน้ำ Kha cho nam (Chiang Mai).
<i>M. kityana</i> Craib	เคือข้าวเย็น Khruea khao yen, ลางเย็น Lang yen, ฮางเย็น Hang yen (Northern).
<i>M. latifolia</i> Dunn	ซะเจา Kha cho (General).
<i>M. leucantha</i> Kurz var. <i>leucantha</i>	กะเซา Kaso (Central); กระเจา Kra cho, ซะเจา Kha cho (Northern); กระพี้เข้าควาย Kra phi khao khwai (Prachuap Khiri Khan); ซะแมงบ Kha maep, คำแมงบ Kham maep (Chiang Mai).
<i>M. leucanthe</i> Kurz var. <i>buteoides</i> (Gagnep.)P.K.Loc ( <i>M. buteoides</i> Gagnep. var.	กระเจ้า Kra cho, ซะเจ้า Kha cho (Lampang); กระท้อน Kra thon, (Phetchabun Phitsanulok); ไม้กระหงน้ำผัก Mai kra tong nam phak (Loei); สะท้อน Benth.)
<i>siamensis</i> Craib, <i>M. pendula</i> Benth.)	Mai kra tong nam phak (Loei); สะท้อน Sa thon (Saraburi); สาคร Sa thon (Ubon Ratchathani).
<i>M. macrostachya</i> Collett & Hemsl. var. <i>macrostachya</i>	ซะเจาะน้ำ Kha cho nam (Chiang Mai).
<i>M. macrostachya</i> Collett & Hemsl. var. <i>tecta</i> Craib	ซะเจาะหลวง Kha cho luang, ซะเจาะใหญ่ Kha cho yai (Narathiwat).
<i>M. pachycarpa</i> Benth.	เกต้า Ke-tha (Karen-Chiang Mai); เคือไหล Khruea lai (Chiang Mai).

<i>M. peguensis</i> Ali	ຕອຫີ To-hi (Karen-Kanchanaburi).
( <i>M. ovalifolia</i> Kurz)	
<i>M. pulcha</i> Benth. Kurz	ຈັນພອ Chan pho (Northern).
<i>M. racemosa</i> (Roxb.)Benth.	= <i>Endosamara racemosa</i> (Roxb.)R. Geesink
<i>M. sericea</i> (Vent.)Benth.	ຈະໄນໂຄົກ Cha-nai-kho, ປາຕູ Paa-tu (Malay-
	Narathiwat); ນອເຈາະ No-ro (Malay-Yala,
	Pattani); ຍິມແມເກົກ Yim-mae-ko (Malay-
	Yala); ອ້ອຍສາມສວນ Oi sam suan (Nong
	Khai).
<i>M. thorelii</i> Gagnep.	= <i>Derris thorelii</i> Craib
<i>M. utilis</i> Dunn	ສະທ້ອນນໍ້າຜັກ Sathon nam phak (Loei).
<i>M. xylocarpa</i> Miq.	ກະເຈົ້າ Ka cho, ຂະເຈາະ Kha cho (General); ຄະແມດ Kha maet (Chiang Mai); ຈັກຈັນ Chakkachan (Loei); ພຶພອ Phi phong (Phrae); ຢະດາ Ya-da (Malay-Yala); ຢ່າຍື Yai-yi (Karen-Mae Hong Son); ສາທອນ Sa thon, ໜໍິນໍ້າ Yi nam (Pattani-Yala).

Although *Millettia erythrocalyx* Gagnep. has not been recorded in Thai Plant Names (Smitinand, 2001), but the herbarium specimens of this species have been kept at the Royal Forest Department, Ministry of Agriculture and Co-operatives.

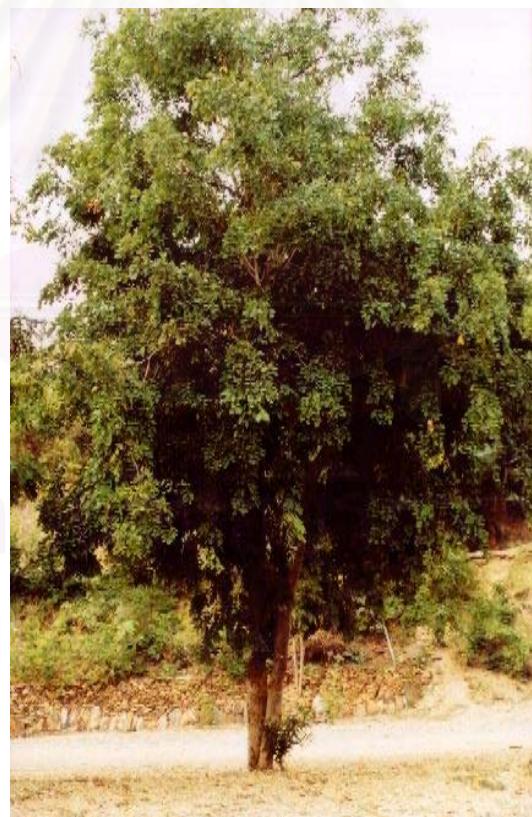

*Millettia erythrocalyx* Gagnep. has a local name as Jun. It is a medium-sized tree reaching 7-8 m. Bark: grayish. Branchlets: rusty strigose, become glabrescent, spotted lenticels prominent. Leaflets 7-11, ovate- or elliptic-lanceolate, papery, 3-6 x 1.5-2 cm., base narrowly cordate, apex caudate, glabrous and shining adaxially, scarlet strigose on midrib and margins abaxially. Pseudoracemes: axillary on the tip of branches, 6-7 cm., densely dark brown strigose; flower 8-9 mm., calyx 3 mm., deep red, sparsely hairy, teeth

truncate, ciliated; corolla lilac, vexillum glabrous, round tapering at base, with 2 minute callus; ovary villose, ovules 4-5. Pod: linear-oblong, 9-10 x 2 cm., flat, slightly curved, tapering to the base, brown tomentose when young, become glabrecent, valves woody, spirally twisted. Seeds: 2-3, chestnut brown, 13 x 10 mm., lens-shaped, smooth. It has been found in Thailand, Laos and Cambodia (Zhi, 2002).

The isolations of several phenolic compounds from the root and the stem bark of *Millettia erythrocalyx* Gagnep. have been earlier described (Sritularak, 2002a and 2002b). The compounds from the stem bark of *M. erythrocalyx* are millettocalyxins A-C, pongol methyl ether, 2'-hydroxy-3,4-methylenedioxy-4'- $\gamma,\gamma$ -dimethylallyloxychalcone, derricidin, 7- $\gamma,\gamma$ -dimethylallyloxyflavanone, ponganone I, karanjin, milletenone, ovalifolin, milletenin C, 3',4'-methylenedioxy-7-methoxyflavone, pongaglabrone, prunetin, vicenin II, isovitexin, lupeol and dihydropheic acid-4'-O- $\beta$ -D-glucopyranoside. The compounds found in the root of *M. erythrocalyx* are 6-methoxy-[2",3":7,8]-furanoflavanone, 2,5-dimethoxy-4-hydroxy-[2",3":7,8]-furanoflavan, 3,4-methylenedioxy-2',4'-dimethoxychalcone, 1-(4-hydroxy-5-benzofuranyl)-3-phenyl-2-propen-1-one, derricidin, purpurenone, pongaglabol, ponganone I, pongamol, ovalitenone, milletenone, ponganoneV and lanceolatin B. So far, the constituents of the leaves of this plant have not been reported. Therefore, in this investigation the following objectives are put forward:

1. to isolate and purify chemical constituents of the leaves of *M. erythrocalyx*
2. to determine the chemical structure of each isolated compound

## CHAPTER II

### HISTORICAL

#### 1. Chemical Constituents of *Millettia* species

Chemical investigations of several *Millettia* species have shown them to be a good source of flavonoids. In addition, other classes of natural compounds such as rotenoids, nitrogenous compounds, terpenoids and miscellaneous substances have been found (Tables 1 and 2).

**Table 1 Distribution of flavonoids in *Millettia* species.**

Plant and compound	Category	Plant part	Reference

## CHAPTER III

### EXPERIMENTAL

#### 1. Sources of Plant Materials

The leaves of *Millettia erythrocalyx* Gagnep. were collected from Tayang district, Petchaburi Province, Thailand, in April 1999. Authentication was performed by comparison with herbarium specimens (BKF No. 130496) at the National Park Wildlife and Plant Conservation Department, Ministry of Natural Resources and Environment, and voucher specimens (KL-032542) are on deposit at the Department of Pharmacognosy, Faculty of Pharmaceutical Sciences, Chulalongkorn University.

#### 2. General Techniques

##### 2.1 Analytical Thin-Layer Chromatography (TLC)

Technique	:	One dimension, ascending
Adsorbent	:	Silica gel 60 F <sub>254</sub> (E. Merck) precoated plate
Layer thickness	:	0.2 mm
Distance	:	6 cm
Temperature	:	Laboratory temperature (30-35°C)
Detection	:	1. Ultraviolet light (254 and 365 nm) 2. Anisaldehyde and heating at 105°C for 10 min.

##### 2.2 Column Chromatography

###### 2.2.1 Vacuum Liquid Column Chromatography

Adsorbent	:	Silica gel 60 (No. 7734) particle size 0.063-0.200 mm (70-230 mesh ASTM) (E. Merck)
Packing method	:	Dry packing
Sample loading	:	The sample was dissolved with an organic solvent, mixed with the adsorbent, triturated, dried and then placed gently on top of the column.
Detection	:	Fractions were examined by TLC observing under UV light (254 and 365 nm).

### **2.2.2 Flash Column Chromatography**

Adsorbent	:	Silica gel 60 (No. 9385) particle size 0.400-0.063 nm (230-400 mesh ASTM) (E. Merck)
Packing method	:	Wet packing
Sample loading	:	The sample was dissolved with the eluent and then applied gently on top of the column.
Detection	:	Fractions were examined in the same manner as described in section 2.3.1.

## **2.3 Spectroscopy**

### **2.3.1 Ultraviolet (UV) Absorbtion Spectra**

UV (in methanol) spectra were obtained on a Milton Roy Spectronic 3000 Array spectrophotometer (Pharmaceutical Reserch Instrument Center, Faculty of Pharmaceutical Sciences, Chulalongkorn University).

### **2.3.2 Infrared (IR) Absorption Spectra**

IR film spectra were recorded on a Perkin Elmer FT-IR 1760X spectrometer (Scientific and Technological Research Equipment Center, Chulalongkorn University).

### **2.3.3 Mass Spectra**

Electrospray ionization mass spectra (ESIMS) and high resolution electrospray ionization mass spectra (HRESIMS) were measured on a mass spectrometer LCT (LC/MS) Micromass (Biotech Central Research Unit, National Center for Genetic Engineering and Biotechnology (NSTDA), Science Park, Pathumthani, Thailand).

### **2.3.4 Proton and Carbon-13 Nuclear Magnetic resonance ( $^1\text{H}$ and $^{13}\text{C-NMR}$ ) Spectra**

$^1\text{H}$  NMR (300 MHz) and  $^{13}\text{C}$  NMR (75 MHz) spectra were obtained with a Bruker Avance DPX-300 FT-NMR spectrometer (Faculty of Pharmaceutical Sciences, Chulalongkorn University)

$^1\text{H}$  NMR (500 MHz) and  $^{13}\text{C}$  NMR (125 MHz) spectra were obtained with a Bruker Avance DRX-500 spectrometer (Biotech Central Research Unit, National Center

for Genetic Engineering and Biotechnology, National Science and Technology Development Agency (NSTDA))

Solvents for NMR spectra were deuterated chloroform (chloroform-*d*) and deuterated acetone (acetone-*d*<sub>6</sub>). Chemical shifts were reported in ppm scale using the chemical shift of the solvent as the reference signal.

## 2.4 Physical property

### 2.4.1 Melting Points

Melting points were obtained on a Gallenkamp Melting Point Apparatus (Department of Pharmaceutical Botany, Faculty of Pharmaceutical Sciences, Chulalongkorn University).

## 2.5 Solvents

Throughout this work, all organic solvents were of commercial grade and were redistilled prior to use.

## 3. Extraction and Isolation

### 3.1 Extraction and Isolation of Compounds from the leaves of *Millettia erythrocalyx*

#### 3.1.1 Extraction

The dried leaves of *Millettia erythrocalyx* (3.5 kg) were macerated with hexane (3 x 20 L), ethyl acetate (3 x 20 L) and ethanol (3 x 23 L) to give a hexane extract (78 g), an ethyl acetate extract (43 g) and an ethanol extract (283 g) after evaporation of the organic solvent.

#### 3.1.2 Isolation

##### 3.1.2.1 Isolation of Compounds from Hexane Extract

The hexane extract (78 g) was separated by vacuum liquid column chromatography using a sintered glass filter column of silica gel 60 (No. 7734, 400 g). The eluates were collected 300 ml per fraction. Elution was performed in a polarity gradient manner with mixtures of petroleum ether and ethyl acetate (100:0 to 0:100). Seventy-five fractions were collected. Fractions with similar TLC pattern (silica gel, EtOAc-Pet. Ether 4:1) were combined to give 14 fractions, as shown in Table 3.

**Table 3 Chromatographic fractions of the hexane extract of *M. erythrocalyx* leaves**

Fraction	Combined fractions	Weight (g)
HQ-1	1	1.5
HQ-2	2	0.5
HQ-3	3	1.6
HQ-4	4	0.3
HQ-5	5	0.9
HQ-6	6	6.1
HQ-7	7-8	10.0
HQ-8	9-12	10.3
HQ-9	13-22	12.2
HQ-10	23-30	9.7
HQ-11	31-33	2.6
HQ-12	34-57	7.8
HQ-13	58-66	0.3
HQ-14	67-75	1.2

### 3.1.2.2 Isolation of Compound MEL1 (3',4'-Methylenedioxy-7-methoxyflavone)

Fraction HQ-12 (7.8 g) was separated by vacuum liquid column chromatography using a sinter glass filter column of silica gel 60 (No. 9385, 100 g). Elution was performed in a polarity gradient manner with petroleum ether and ethyl acetate as the eluents (100:0 to 0:100). Fractions with similar TLC patterns (silica gel, Pet. Ether-EtOAc 1: 4) were combined to yield 10 fractions: fractions A (464 mg), B (679 mg), C (1.7 g), D (1.2 g), E (739 mg), F (375 mg), G (1.5 g), H (541 mg), I (160 mg) and J (439 mg).

Fraction D (1.2 g) was subjected to column chromatography with petroleum ether-ethyl acetate gradient elution. Fractions with similar TLC pattern were combined to afford 15 fractions: fractions D1 (18 mg), D2 (27 mg), D3 (29 mg), D4 (179 mg), D5 (292 mg), D6 (71 mg), D7 (27 mg), D8 (23 mg), D9 (16 mg), D10 (16 mg), D11 (21 mg), D12 (21 mg), D13 (95 mg), D14 (2 mg), D15 (11 mg). Fraction D8 (23 mg) was recrystallized from petroleum ether-chloroform to give white needles of compound MEL1 (2 mg,  $R_f$  0.33, silica gel, pet. ether-EtOAc 1:1). This compound was identified as 3',4'-methylenedioxy-7-methoxyflavone.

### **3.1.2.3 Isolation of Compound MEL2 (3',5'-dimethoxy[2'',3'':7,8]furanoflavone)**

Fraction D4 (179 mg) was separated by column chromatography (silica gel 60 No. 9385) using the mixture of petroleum ether-EtOAc (4:1) as eluent. Fractions were combined according to their chromatographic pattern (pet. ether-EtOAc 1:1) to give D4-1 to D4-5. Fraction D4-2 gave compound MEL2 (2 mg,  $R_f$  0.4, silica gel, pet. ether-EtOAc 1:1). Compound MEL2 (3 mg) was also obtained by separating fraction D4-5 (7 mg) on a silica gel column (gradient elution, pet. ether-EtOAc 83.5:16.5 to 50:50). This compound was later identified as a new furanoflavone, 3',5'-dimethoxy[2'',3'':7,8]furanoflavone.

### **3.1.2.4 Isolation of Compound MEL3 (Pongaglabrone)**

Fraction D5 (292 mg) was subjected to silica gel 60 column chromatography, eluted with gradient mixtures of ethyl acetate and pet. ether (20:80 to 50:50). Six combined fractions (D5-1 to D5-6) were collected from this column. Fraction D5-4 (232 mg) was continuously separated on a silica gel 60 column with isocratic elution of pet. ether-EtOAc (6:1) until giving 6 fractions (D5-4-1 to D5-4-6). Compound MEL3 (4 mg,  $R_f$  0.38, silica gel, pet. ether- EtOAc 1:1) was obtained as a white powder from fraction D5-4-2. This compound was identified as pongaglabrone.

Fraction D5-4-6 (88 mg) was purified by silica gel 60 column chromatography using gradient elution of pet. ether-EtOAc (83.5:16.5 to 50:50). The eluates were collected and combined according to their chromatographic pattern (pet. ether-EtOAc 1:1) to give 4 fractions (D5-4-6A to D5-4-6D). Compound MEL1 (5.6 mg,  $R_f$  0.33, silica gel, pet. ether-EtOAc 1:1) was obtained by recrystallization of fraction D5-4-6C (13 mg) from CHCl<sub>3</sub>-pet. ether.

### **3.1.2.5 Isolation of Compound MEL4 (Gamatin) and MEL5 (Milletenin C)**

Fraction H (541 mg) was separated on a silica gel 60 column (gradient elution, pet. ether-EtOAc 80:20 to 50:50). Fractions with similar chromatographic pattern were combined to give 9 fractions (H1 to H9).

Fraction H6 (140 mg) was separated over a silica gel 60 column with mixtures of pet. ether-EtOAc (80:20 to 50:50) as eluent. Similar fractions were combined after examination by TLC (pet. ether-EtOAc 1:1) to give 3 fractions (H6-1 to H6-3).

Fraction H6-2 (42 mg) was further separated on a silica gel 60 column, eluted with pet. ether-EtOAc (1:2). Sixteen fractions were collected, examined by TLC (silica gel, pet. ether-EtOAc 1:2) and combined to give 4 major fractions (H6-2-1 to H6-2-4). Fraction H6-2-3 (31 mg) was subjected to silica gel 60 column chromatography, eluted with 0.5% MeOH in CHCl<sub>3</sub> to give 21 fractions. Fractions with similar TLC patterns (silica gel, pet. ether-EtOAc 1:2) were combined to give 3 fractions (H6-2-3A to H6-2-3C). Fraction H6-2-3C, after removal of solvent, gave compound MEL4 (4 mg, *R*<sub>f</sub> 0.20, silica gel, pet. ether-EtOAc 1:2) as colorless needles, which was later identified as gamatin. Fraction H6-2-3A, after removal of solvent, gave compound MEL5 (13 mg, *R*<sub>f</sub> 0.24, silica gel, pet. ether-EtOAc 1:2) as a white powder. This compound was identified as milletenin C.

Fraction H6-2-3B (14 mg) was further purified on a silica gel 60 column, eluted with 0.5% MeOH in CHCl<sub>3</sub> to afford 4 mg of compound MEL5 (milletenin C, *R*<sub>f</sub> 0.24, silica gel, pet. ether-EtOAc 1:2) and compound MEL4 (gamatin, 7 mg, *R*<sub>f</sub> 0.20, silica gel, pet. ether- EtOAc 1:2).

### 3.1.2.6 Isolation of Compound MEL6 (Milletocalyxin A)

Fraction G (1.5 g) was subjected to silica gel 60 column chromatography (gradient elution, pet. ether-EtOAc 85.7:14.3 to 33.3:66.7) to give 38 fractions. Similar fractions were combined after examination by TLC (pet. ether-EtOAc 1:1) to give 5 fractions (G1-G5).

Fraction G4 (915 mg) was further separated on a silica gel 60 column. Elution was performed with pet. ether-EtOAc gradient (85.7:14.3 to 50:50) to give 27 fractions. The eluates were combined on the basis of their TLC composition (silica gel, pet. ether-EtOAc 1:1) to yield 6 fractions (G4-1 to G4-6).

Fraction G4-4 (541 mg) was further separated by silica gel 60 column chromatography, eluted with gradient mixtures of pet. ether-EtOAc (85.7:14.3 to 50:50). Fractions (37 fractions) with similar chromatographic patterns were combined (TLC, silica gel, pet. ether-EtOAc 1:1) to give 5 fractions (G4-4-1 to G4-4-5).

Fraction G4-4-4 (179 mg) was purified on a silica gel 60 column with 0.5% MeOH in CHCl<sub>3</sub> as eluent. Fractions 5-10 from this column, after removal of the solvent, gave compound MEL6 (14 mg, *R*<sub>f</sub> 0.33, silica gel, pet. ether-EtOAc 1:2) as a white powder. It was identified as millettocalyxin A.

### 3.1.2.7 Isolation of Compound MEL7 (Millettocalyxin C)

Fraction G2 (15 mg) was subjected to silica gel 60 column chromatography, eluted with pet. ether-EtOAc (5:1) to give 11 fractions. Similar fractions were combined after examination by TLC (pet. ether-EtOAc 1:2) to give 3 fractions (G2-1 to G2-3). Fraction G2-2 (3 mg) was recrystallized from CHCl<sub>3</sub> –pet. ether to give a yellow powder of compound MEL7 (1 mg, *R*<sub>f</sub> 0.45, silica gel, pet. ether-EtOAc 1:2). This compound was identified as millettocalyxin C.

Fraction G3 (135 mg) was separated on a silica gel 60 (No. 9385) column. Elution was performed with pet. ether-EtOAc (5:1) to give 29 fractions. Fractions with similar TLC pattern (silica gel, pet. ether-EtOAc 1:2) were combined to give 4 fractions (G3-1 to G3-4). Fraction G3-2 (2 mg) gave compound MEL7 (millettocalyxin C, *R*<sub>f</sub> 0.45, silica gel, pet. ether-EtOAc 1:2) as a yellow powder.

Repeated column chromatography of fraction G3-3 (45 mg, silica gel 60, pet. ether-EtOAc 5:1) gave 5 mg of compound MEL1 (3',4'-methylenedioxy-7-methoxyflavone, *R*<sub>f</sub> 0.45, silica gel, pet. ether-EtOAc 1:2).

Fraction D5-4-6A-3 (2 mg) was purified on a silica gel 60 column (gradient elution, pet. ether-EtOAc 83.5:16.5 to 66.7:33.3) to afford 1 mg of compound MEL7 as a yellow powder (millettocalyxin C, *R*<sub>f</sub> 0.45, silica gel, pet. ether-EtOAc 1:2).

Fraction D5-4-5 (3 mg) was further separated on a silica gel 60 column (gradient elution, pet. ether-EtOAc 85.7:14.3 to 80:20). Fractions (10 fractions) showing similar TLC pattern were combined (silica gel, pet. ether-EtOAc 1:2) to give 2 fractions (D5-4-5A and D5-4-5B). Repeated column chromatography of fraction D5-4-5B (2 mg) (silica gel, pet. ether-EtOAc 5:1) gave 1 mg of compound MEL7 (millettocalyxin C, *R*<sub>f</sub> 0.45, silica gel, pet. ether-EtOAc 1:2).

## 4. Physical and Spectral data of Isolated Compounds

### 4.1 Compound MEL1

- Compound MEL1 was obtained as a white powder (13 mg), soluble in CHCl<sub>3</sub>.  
 Melting Point : 201-202°C  
 ESIMS : [M+H]<sup>+</sup> *m/z* 297.11(positive ion mode); **Figure 12**  
 UV :  $\lambda_{\text{max}}$  nm (log ε), in methanol; **Figure 13**  
 236 (4.13), 334 (4.06)

- IR :  $\nu_{\max}$  cm<sup>-1</sup>, Film; **Figure 14**  
           2916, 1643, 1609, 1589, 1502, 1449, 1240, 1202, 1165, 1134, 1032  
<sup>1</sup>H NMR :  $\delta$  ppm, 300 MHz, in acetone-*d*<sub>6</sub>, **Table 4; Figure 15**  
<sup>13</sup>C NMR :  $\delta$  ppm, 75 MHz, in acetone-*d*<sub>6</sub>, **Table 4; Figure 16**

#### 4.2 Compound MEL2

- Compound MEL2 was obtained as colorless needles (5 mg), soluble in CHCl<sub>3</sub>.  
 Melting Point : 178-180°C  
 HRESIMS : [M+H]<sup>+</sup> *m/z* 323.0916 (calcd. for C<sub>19</sub>H<sub>14</sub>O<sub>5</sub> = 323.0920); **Figure 18**  
 ESIMS: [M+H]<sup>+</sup> *m/z* 323.13 (positive ion mode); **Figure 17**  
 UV :  $\lambda_{\max}$  nm (log ε), in methanol; **Figure 19**  
           215 (3.87), 240 (3.55), 263 (3.44), 303 (3.49)  
 IR :  $\nu_{\max}$  cm<sup>-1</sup>, Film; **Figure 20**  
           1630, 1607, 1583, 1426, 1210, 1160, 1140, 1060  
<sup>1</sup>H NMR :  $\delta$  ppm, 300 MHz, in CDCl<sub>3</sub>, **Table 5; Figure 21**  
<sup>13</sup>C NMR :  $\delta$  ppm, 75 MHz, in CDCl<sub>3</sub>, **Table 5; Figure 22**

#### 4.3 Compound MEL3

- Compound MEL3 was obtained as a white powder (4 mg), soluble in CHCl<sub>3</sub>.  
 Melting Point : 220-222°C  
 ESIMS : [M+H]<sup>+</sup> *m/z* 307.11 (positive ion mode); **Figure 30**  
 UV :  $\lambda_{\max}$  nm (log ε), in methanol; **Figure 31**  
           215 (4.50), 240 (4.35), 326 (4.24)  
 IR :  $\nu_{\max}$  cm<sup>-1</sup>, Film; **Figure 32**  
           2917, 1641, 1596, 1505, 1447, 1405, 1347, 1256, 746  
<sup>1</sup>H NMR :  $\delta$  ppm, 300 MHz, in CDCl<sub>3</sub>, **Table 6; Figure 33**  
<sup>13</sup>C NMR :  $\delta$  ppm, 75 MHz, in CDCl<sub>3</sub>, **Table 6; Figure 34**

#### 4.4 Compound MEL4

- Compound MEL4 was obtained as colorless needles (11 mg), soluble in CHCl<sub>3</sub>.  
 Melting Point : 227-228°C  
 ESIMS : [M+H]<sup>+</sup> *m/z* 337.13 (positive ion mode); **Figure 36**  
 UV :  $\lambda_{\max}$  nm (log ε), in methanol; **Figure 37**  
           250 (4.38), 333 (4.24)  
 IR :  $\nu_{\max}$  cm<sup>-1</sup>, Film; **Figure 38**  
           2920, 1646, 1583, 1507, 1452, 1329, 1261, 1160, 1072, 756

<sup>1</sup>H NMR : δ ppm, 300 MHz, in CDCl<sub>3</sub>, **Table 7; Figure 39**

<sup>13</sup>C NMR : δ ppm, 75 MHz, in CDCl<sub>3</sub>, **Table 7; Figure 40**

#### 4.5 Compound MEL5

Compound MEL5 was obtained as a white powder (17 mg), soluble in CHCl<sub>3</sub>.

Melting Point : 250-252°C

ESIMS : [M+H]<sup>+</sup> *m/z* 327.16 (positive ion mode); **Figure 48**

UV : λ<sub>max</sub> nm (log ε), in methanol; **Figure 49**

211 (4.71), 240 (4.47), 333 (4.50)

IR : ν<sub>max</sub> cm<sup>-1</sup>, Film; **Figure 50**

2918, 1639, 1591, 1508, 1478, 1453, 1335, 1265, 1085, 752

<sup>1</sup>H NMR : δ ppm, 300 MHz, in CDCl<sub>3</sub>, **Table 8; Figure 51**

<sup>13</sup>C NMR : δ ppm, 75 MHz, in CDCl<sub>3</sub>, **Table 8; Figure 52**

#### 4.6 Compound MEL6

Compound MEL6 was obtained as a white powder (14 mg), soluble in CHCl<sub>3</sub>.

Melting Point : 210-212°C

ESIMS : [M+Na]<sup>+</sup> *m/z* 350.06 (positive ion mode)

[M+H]<sup>+</sup> *m/z* 327.12 (positive ion mode); **Figure 53**

UV : λ<sub>max</sub> nm (log ε), in methanol; **Figure 54**

247 (4.31), 300 (4.14), 360 (4.27)

IR : ν<sub>max</sub> cm<sup>-1</sup>, Film; **Figure 55**

1648, 1620, 1569, 1502, 1262, 1195, 1170, 1023, 826

<sup>1</sup>H NMR : δ ppm, 300 MHz, in acetone-*d*<sub>6</sub>, **Table 9; Figure 56**

<sup>13</sup>C NMR : δ ppm, 75 MHz, in acetone-*d*<sub>6</sub>, **Table 9; Figure 57**

#### 4.7 Compound MEL7

Compound MEL7 was obtained as a yellow powder (5 mg), soluble in CHCl<sub>3</sub>.

Melting Point : 166-168°C

ESIMS : [M+H]<sup>+</sup> *m/z* 323.14 (positive ion mode); **Figure 60**

UV : λ<sub>max</sub> nm (log ε), in methanol; **Figure 61**

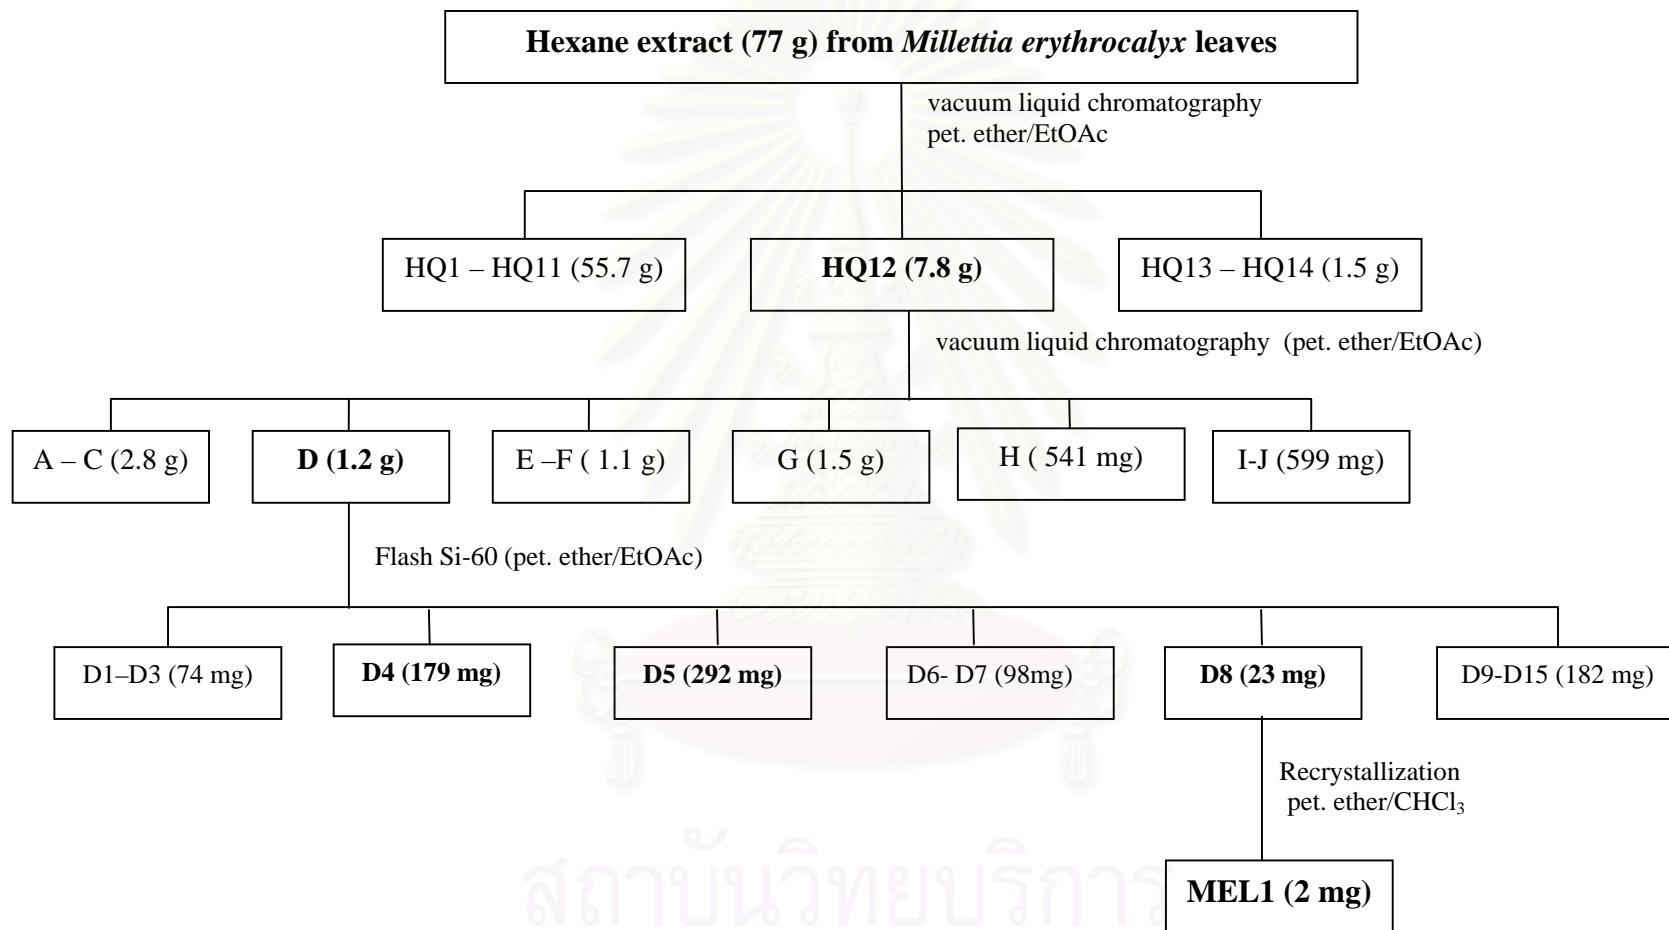

248 (4.25), 293 (3.95)

IR : ν<sub>max</sub> cm<sup>-1</sup>, Film; **Figure 62**

## CHAPTER IV

### RESULTS AND DISCUSSION

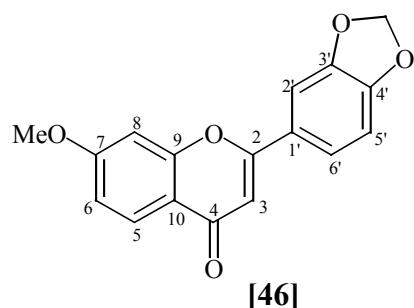

The leaves of *Millettia erythrocalyx* Gagnep. (3.5 kg) were extracted with hexane, ethyl acetate and ethanol, successively, to give a hexane extract (78 g), an ethyl acetate extract (43 g) and an ethanol extract (283 g), respectively. The hexane extract was further separated using several chromatographic techniques to yield seven pure compounds (MEL1 to MEL7).

The structures of all of the isolates were determined by interpretation of their UV, IR, NMR and MS data, and further confirmed by comparison of these spectral properties with literature values.

#### 1. Structure Determination of Isolated Compounds

##### 1.1 Structure Determination of Compound MEL1

Compound MEL1 was obtained as a white powder. It has a molecular formula of C<sub>17</sub>H<sub>12</sub>O<sub>5</sub>, as indicated by the molecular ion peak at *m/z* 297.1 in the ESIMS (**Figure 12**). The IR spectrum (**Figure 14**) showed absorption bands at 1643 (conjugated carbonyl), 1589 (conjugated C=C) and 1449 (CH<sub>2</sub> bending)cm<sup>-1</sup>, and the UV absorptions at 236 and 334 nm (**Figure 13**) were indicative of a flavone nucleus (Markham, 1982). The <sup>1</sup>H NMR spectrum (**Table 4**, **Figure 15**) exhibited signals for an aromatic singlet signal (H-3) at δ 6.67 (1H, s), a methoxyl at δ 3.97 (1H, s) and a methylenedioxy at δ 6.14 (2H, s). The presence of two doublets at δ 7.23 (*J* = 2.1 Hz, H-8) and δ 7.98 (*J* = 8.7 Hz, H-5) and a double doublet at δ 7.03 (*J* = 8.7, 2.1 Hz, H-6) placed the methoxyl group at C-7. The ABM splitting system at δ 7.55 (d, *J* = 1.5 Hz, H-2'), 7.02 (d, *J* = 8.4 Hz, H-5') and 7.65 (dd, *J* = 8.4, 1.5 Hz, H-6'), along with the <sup>3</sup>J correlation peak of H-2' with C-2 (δ 163.14), indicated the location of the methylenedioxy group at C-3' and C-4'. These <sup>1</sup>H and <sup>13</sup>C NMR data were in good agreement with those reported for 3',4'-methylenedioxy-7-methoxyflavone [**46**] (Mahmoud and Waterman, 1985).

## 1.2 Structure Determination of Compound MEL2

Compound MEL2, colorless needles, exhibited a molecular ion  $[M+H]^+$  peak at  $m/z$  323.1 in the ESIMS, indicating a molecular formula of  $C_{19}H_{14}O_5$ . The IR spectrum displayed absorption bands at 1630 (conjugated C=O stretching), 1583 (conjugated C=C) and 1210 and 1060 (C-O stretching)  $\text{cm}^{-1}$  (**Figure 20**), and the UV absorptions at 240, 263 and 303 nm (**Figure 19**) were indicative of a furanoflavone (Mbafor *et al.*, 1995). This was supported by the  $^1\text{H}$  and  $^{13}\text{C}$  NMR signals (**Table 5, Figures 21 and 22**) for H-3 at  $\delta$  6.84 (1H, s) and C-3 at  $\delta$  106.8, for a furan ring at  $\delta$  7.18 (d,  $J = 2.1$ , H-4'')/  $\delta$  104.2(C-4'') and  $\delta$  7.76 (d,  $J = 2.1$ , H-5'')/  $\delta$  145.8 (C-5''). The furan ring could be fused in an angular position at C-7 and C-8, as supported by the presence of two doublets at  $\delta$  8.15 (d,  $J = 9.0$ , H-5) and  $\delta$  7.55 (d,  $J = 9.0$ , H-6) and the HMBC correlations of H-5 with C-4 ( $\delta$  178.2) and H-6 with C-10 ( $\delta$  119.4) (**Figures 25-27**). Furthermore, the HMBC correlations of C-7 ( $\delta$  158.4) with H-4'' and H-5'' and C-8 ( $\delta$  117.2) with H-4'' and H-5'' were also observed. The presence of two methoxyl groups was revealed by the proton resonance at  $\delta$  3.88 (6H, s) and the carbon signal at  $\delta$  55.6. To determine the location of the two methoxyls on ring B, a NOESY experiment (**Figures 28 and 29**) was carried out. The NOE interactions of the methoxyl protons with the proton at  $\delta$  7.07 (d,  $J = 2.1$ , H-2') and with the proton at  $\delta$  6.63 (t,  $J = 2.1$ , H-4') placed the methoxyls at C-3' and C-5'. Interactions through  $^3J$  coupling of C-2 with H-2' and H-6', and C-4' ( $\delta$  103.3) with H-2' and H-6', were also observed in the HMBC spectrum. On the basis of the above spectroscopic data, compound MEL2 was identified as a new compound, 3',5'-dimethoxy [2'',3'':7,8]furanoflavone [**236**].

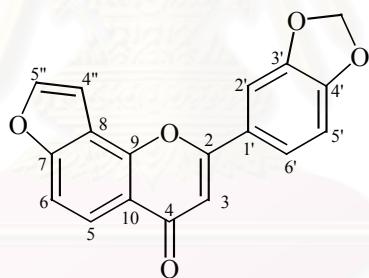

[236]

### 1.3 Structure Determination of Compound MEL3

Compound MEL3 was obtained as a white powder. The molecular formula was determined as  $C_{18}H_{10}O_5$  by ESIMS of its  $[M+H]^+$  ion at  $m/z$  307.1. Its IR spectrum (**Figure 32**) exhibited absorption bands at  $1641\text{ cm}^{-1}$  (conjugated C=O),  $1596\text{ cm}^{-1}$  (conjugated C=C) and  $1447\text{ cm}^{-1}$  ( $\text{CH}_2$  bending). The UV spectrum maximum absorptions at 240 and 326 nm (**Figure 31**) and the  $^1\text{H}$  NMR signal at  $\delta$  6.74 (1H, s, H-3) were suggestive of a furanoflavone nucleus (**Table 6**, **Figure 33**). The  $^1\text{H}$  and  $^{13}\text{C}$  NMR signals for a furan ring at  $\delta$  7.18 (1H, d,  $J = 1.8$ , H-4'')/  $\delta$  104.1 (C-4'') and  $\delta$  7.75 (1H, d,  $J = 1.8$ , H-5'')/  $\delta$  145.8 (C-5'') were observed. In the  $^1\text{H}$  NMR spectrum, the signal for 3', 4'-methylenedioxy substitution on ring B appeared at  $\delta$  6.08 (2H, s), and three protons signals at  $\delta$  7.38 (1H, d,  $J = 1.8$  Hz), 6.95 (1H, d,  $J = 8.1$  Hz) and 7.51 (1H, dd,  $J = 8.1$ , 1.8 Hz) were assigned to H-2', H-5' and H-6', respectively. Compound MEL3 was identified as pongaglabrone [**54**] based on the above spectral data. Its  $^1\text{H}$  NMR properties are in agreement with previously published values (Garcez *et al.*, 1988).

#### 1.4 Structure Determination of compound MEL4

Compound MEL4 was obtained as colorless needles. The ESI mass spectrum (**Figure 36**) displayed the quasi-molecular ion peak  $[M+H]^+$  at  $m/z$  337.13, analysed for  $C_{19}H_{12}O_6$ . The UV spectrum (**Figure 37**) exhibited absorption maxima at 250, 333 nm. The IR spectrum (**Figure 38**) showed  $\nu_{\text{max}}$  at 1646 (conjugated C=O), 1583 (conjugated C=C) and 1452 ( $\text{CH}_2$  bending)  $\text{cm}^{-1}$ . The  $^1\text{H}$  NMR signal at  $\delta$  6.55 (1H, s, H-3) was characteristic of a furanoflavone nucleus. The  $^1\text{H}$  NMR signals (**Table 7, Figure 39**) at  $\delta$  7.03 (1H, d,  $J = 2.1$  Hz) and  $\delta$  7.58 (1H, d,  $J = 2.1$  Hz) were assigned as H-4'' and H-5'' for the furan ring. The methoxyl signal appeared at  $\delta$  4.18 ppm. The HMBC correlations (**Figures 45-47**) of H-8 with C-6 and C-10 indicated the location of the furan ring on C-6 and C-7, and the correlations of C-5 with protons of the methoxyl group suggested the attachment of the methoxyl group at C-5. This was supported by the NOESY correlation between H-4'' and the methoxyl group at C-5 (**Figures 43 and 44**). The characteristic signal for the methylenedioxy substituted B-ring was found at  $\delta$  6.05 (2H, s). The presence of an ABX spin system at  $\delta$  7.32 (1H, d,  $J = 1.5$  Hz, H-2'),  $\delta$  6.90 (1H, d,  $J = 8.1$  Hz, H-5') and  $\delta$  7.46 (1H, dd,  $J = 8.1, 1.5$  Hz, H-6') in the  $^1\text{H}$  NMR spectrum placed the methylenedioxy group at C-3' and C-4' positions. Based on the above spectral evidence, compound MEL4 was identified as gamatin [237] (Pathak and Khanna, 1981).

### 1.5 Structure Determination of compound MEL5

Compound MEL5, a white powder, showed its quasi-molecular ion  $[M+H]^+$  at  $m/z$  327.2 in the ESIMS (**Figure 48**), indicating a molecular formula of  $C_{18}H_{14}O_6$ . The UV spectral data displayed maximum absorptions at 211, 240 and 333 nm (**Figure 49**). The IR spectrum showed  $\nu_{max}$  at 1639 (conjugated C=O), 1591 (conjugated C=C) and 1453 (CH<sub>2</sub> bending)  $cm^{-1}$  (**Figure 50**). The <sup>1</sup>H NMR spectrum exhibited a singlet signal of H-3 at  $\delta$  6.65 (**Table 8, Figure 51**). These data were indicative of a flavone nucleus. Two proton singlet signals at  $\delta$  7.54 and 6.95 were assigned to the aromatic protons H-5 and H-8 of ring A. The methylenedioxy group on ring B was observed at  $\delta$  6.05 (2H, s) and  $\delta_C$  101.9 ppm. Furthermore, the <sup>1</sup>H NMR spectrum revealed the presence of two methoxyl groups at  $\delta$  3.97 and 3.99 ppm. The NOESY correlation of the methoxyl groups with H-5 and H-8 suggested the attachment of the methoxyls group at C-6 and C-7 (**Figure 54**). By analyses of the <sup>1</sup>H and <sup>13</sup>C NMR data and comparison with previously reported data (Parma, Gupta and Sharma, 1989), compound MEL5 was identified as milletenin C [**45**].

### 1.6 Structure Determination of compound MEL6

Compound MEL6 was obtained as a white powder. It showed a quasi-molecular  $[M+H]^+$  ion peak at  $m/z$  327.1 in the ESIMS (**Figure 55**), suggesting a molecular formula of  $C_{18}H_{14}O_6$ . The UV spectrum showed maximum absorptions at 247, 300, 360 nm (**Figure 56**). The IR spectrum displayed  $\nu_{max}$  at 1648 (conjugated C=O), 1620 and 1569  $cm^{-1}$  (conjugated C=C) (**Figure 57**). The  $^1H$  NMR signal at  $\delta$  6.88 (1H, s, H-3) was indicative of a flavone skeleton. The  $^1H$  and  $^{13}C$  NMR spectra (**Table 9, Figures 58 and 59**) revealed the presence of a methylenedioxy group at  $\delta_H$  6.10 (2H, s) and  $\delta_C$  102.8 ppm and two methoxyl groups at  $\delta_H$  3.96 (s)/  $\delta_C$  56.1 and  $\delta_H$  3.96 (s)/ $\delta_C$  56.8 ppm. For ring A, the two doublets at  $\delta$  7.98 (d,  $J$  = 9.0 Hz, H-5) and  $\delta$  7.21 (d,  $J$  = 2.4 Hz, H-8) and the double doublet at  $\delta$  7.01 (dd,  $J$  = 9.0, 2.4 Hz, H-6), placed one of the methoxyls at C-7. The two proton signals at  $\delta$  6.90 (1H, s) and  $\delta$  7.47 (1H, s) suggested their *para*-relation on ring B (H-3' and H-6'). Thus, the other methoxyl group should be located at C-2'. The  $^1H$  and  $^{13}C$  NMR data were in good agreement with those of millettocalyxin A [**48**], a flavone earlier isolated from the stem bark of this plant (Sritularak *et al.*, 2002a).

### 1.7 Structure Determination of compound MEL7

Compound MEL7, a yellow powder, exhibited a quasi-molecular ion  $[M+H]^+$  peak at  $m/z$  323.1 in the ESIMS (**Figure 62**), analyzed for  $C_{19}H_{14}O_5$ . It showed UV absorptions at 248 and 293 nm (**Figure 63**). The IR spectrum displayed absorption bands at 1626 (conjugated C=O), 1588 (conjugated C=C), 1186 and 1074 (C-O stretching)  $\text{cm}^{-1}$  (**Figure 64**). The  $^1\text{H}$  NMR signal at 7.20 (1H, s, H-3) was suggestive of a furanoflavone nucleus (**Table 10, Figure 65**) (Mbafor *et al.*, 1995). The  $^1\text{H}$  NMR spectrum provided signals for a furan ring at  $\delta$  7.15 (1H, d,  $J = 1.5$  Hz, H-4'') and 7.73 ppm (1H, d,  $J = 1.8$  Hz, H-5''). This spectrum also exhibited the presence of two methoxyls at  $\delta$  3.86 (3H, s) and 3.89 ppm (3H, s). The *ortho*-coupled protons at  $\delta$  8.15 (1H, d,  $J = 8.7$  Hz) and 7.54 ppm (1H, d,  $J = 8.7$  Hz) were assigned to H-5 and H-6, respectively. The three coupled aromatic protons at  $\delta$  6.98 (1H, d,  $J = 9.0$  Hz), 7.04 (1H, dd,  $J = 9.0, 3.0$  Hz) and 7.49 (1H, d,  $J = 3.0$  Hz) were assigned to H-3', H-4' and H-6', respectively. By comparing the above spectral information with reported the  $^1\text{H}$  and  $^{13}\text{C}$  NMR data, compound MEL7 was identified as millettocalyxin C [**50**], which was previously isolated from the stem bark of this plant (Sritularak *et al.*, 2002a).

## **CHAPTER V**

### **CONCLUSION**

Phytochemical investigation of the leaves of *Millettia erythrocalyx* Gagnep. led to the isolation of seven flavonoid compounds. The structure of all of these isolates were determined by extensive spectroscopic studies, including comparison of their UV, IR, MS and NMR properties with previously reported data. These include a new furanoflavone compound, namely 3', 5'-dimethoxy[2",3":7,8]furanoflavone, and the known flavone compounds 3',4'-methylenedioxy-7-furanoflavone, pongaglabrone, gamatin, milletenin C, millettocalyxin A and millettocalyxin C.
