The characteristic of the plants extracts are summarized in the **Table 6**

Table 6. The characteristic of the plant extracts

Plants	Extract characteristic
<i>P. mirifica</i>	Sticky wax-like material with brown color. Smell-like ground peanut.
<i>B. superba</i>	Sticky wax-like material with dark brown color. Smell-like ground peanut
<i>M. collettii</i>	Sticky wax-like crystal with black color. Very strong smell.

2. Proliferative effect of puerarin

Puerarin at the concentration of 10^{-6} , 10^{-7} , 10^{-8} , 10^{-9} , 10^{-10} , 10^{-11} , 10^{-12} , 10^{-13} M. was compared with Estradiol at 10^{-10} , 10^{-11} , 10^{-12} M. in the incubation test with MCF-7 cells. Puerarin at the concentration of 10^{-6} M. and Estradiol at the concentration of 10^{-10} M showed proliferative effect to MCF-7 cells.

Table 7 The percentage growth of Puerarin and Estradiol on MCF-7 cells

concentration	Estradiol (%growth of MCF-7)	Puerarin(%growth of MCF-7)
10^{-6} M	-	130 ^a
10^{-7} M	-	124 \pm 16.04
10^{-8} M	-	124 \pm 12.77
10^{-9} M	-	118 \pm 19.40
10^{-10} M	146 \pm 5.81*	122 \pm 8.19
10^{-11} M	142 \pm 36.10	112 \pm 4.06
10^{-12} M	130 \pm 15.25	106 \pm 14.25
10^{-13} M	-	106 \pm 8.08

a: n=1, others n=3

* significant , $p < 0.05$

3. Cytotoxicity test

3.1 *Pueraria mirifica*

The wild *P. mirifica* collected from 28 provinces in Thailand showed variation of estrogenic activity. *P. mirifica* extracts show clearly biphasic effect with MCF-7 cell culture. The extract stimulated the cellular proliferation at the concentration of 1 µg/ml ($p < 0.05$) and partially inhibited the cellular proliferation at the concentration of 1,000 µg/ml. (Table 18 and Figure 7). There were 16 samples, from the higher- to the lower-order of proliferative effect at the concentration of 1 µg/ml, including Phitsanuloke, Nakhon Sawan, Phetchabun, Sukhothai, Nan, Chiang Rai, Chiang Mai, Prachuap Khiri Khan, Ratchaburi, Mae Hong Son, Lamphun, Chumphon, Phrae, Chaiyaphum, Lop Buri and Prachinburi exhibited significant proliferation effect. Interestingly, the crude extract collected from Phitsanuloke at the concentration of 1 µg/ml showed proliferative effect (145.70 \pm 8.93%), the same as estradiol at the concentration of 10⁻¹⁰ M.(146 \pm 5.81%).

The mean values of proliferative effect dose (1 µg/ml) of each samples were compared with the mean value of population. Phitsanulok and Nakhon Sawan samples exhibited significant higher value than the mean value of the population (121.31 \pm 1.56 %) (Table 17).

The analysis of the collected samples during 3 different seasons from the 2 years old plants cultivated in the same field at Ratchaburi province confirmed the variation of anti-proliferative effect (Table 19, Figure 8). The sample from Chaiprakan collected in rainy season showed the highest anti-proliferative effect.

3.2 *Butea superba*

The wild *B. superba* collected from 24 provinces in Thailand showed variation of proliferative- and anti-proliferative effect. We could divide *B. superba* into 2 groups. The first group, comprise only Mae Hong Son, stimulated the cellular proliferation at the concentration of 0.1 µg/ml ($p < 0.05$) (Table 21 and Figure

9). The other samples showed no proliferative effect. There was only Prachinburi ($78.55\pm4.65\%$) exhibited significant lower than mean. (Table 20)

B. superba inhibited the cellular anti-proliferation at the concentrations of 100-1,000 $\mu\text{g}/\text{ml}$. There were 10 samples, including sample collected from Kanchanaburi (IC_{50} 76.65), Ratchaburi (IC_{50} 109.82), Tak (IC_{50} 184.35), Phitsanulok (IC_{50} 344.12), Srisaket (IC_{50} 381.97), Khon Kaen (IC_{50} 545.29), Nakhon Ratchasima (IC_{50} 546.23), Chachoengsoa (IC_{50} 606.58), Petchabun (IC_{50} 683.87), and Uttharadith (IC_{50} 733.87) exhibited IC_{50} value lower than 1,000 $\mu\text{g}/\text{ml}$.

3.3 *Mucuna collettii*

M. collettii collected from 4 provinces showed no proliferative effect. The extracts inhibited the cellular proliferation at the concentrations of 10-1,000 $\mu\text{g}/\text{ml}$ ($p < 0.05$). (Table 22 and Figure 10) All collected samples of *M. collettii* exhibited IC_{50} value lower than 1,000 $\mu\text{g}/\text{ml}$. Only the sample collected from Kanchanaburi showed significant stronger IC_{50} than the mean value of the population ($31.87\pm3.94 \mu\text{g}/\text{ml}$)

3.4 Correlation of isoflavone content in *P. mirifica* collected from 28 provinces with proliferative effect

- I. Direct assay with puerarin-
-estradiol and crude extracts of *P. mirifica* exhibited stronger proliferative effect than puerarin.
- II. Indirect assay with isoflavone content (Subtang, 2002). It was convinced that the proliferative effects might relate with daizein. Daizein contents of the first 5 highest proliferative effects were significantly ($p < 0.05$) higher than the left, 23 samples. Interestingly, aglycoside isoflavone, daizein and genistein contents of the first 5 highest proliferative effects were significantly ($p < 0.05$) higher than the left. Genistein of the first 5 highest proliferative effects exhibited no significant ($p < 0.05$).

Table 8 The percentage growth of MCF-7 of the first 5 highest proliferation effect in correlation with isoflavone content (%)

No.	Source	Proliferation effect(1 μ g/ml)	Puerarin (%)	Daidzin (%)	Genistin (%)	Daidzein (%)	Genistein (%)
1	Phitsanulok	145.70 \pm 8.93	41.94 \pm 0.34	14.60 \pm 0.21	31.58 \pm 0.23	9.95 \pm 0.06	1.94 \pm 0.02
