

## CHAPTER 6

### Future work

1. In this experiment, only the average roughness (Ra) was measured. Furthermore, to confirm the abrasive property of prophylaxis paste, a prophylaxis paste index (PPI) should be evaluated by measuring the cleaning ability, the REA (Relative enamel abrasive) or the RDA (Relative dentin abrasive) values in addition to the average roughness (Ra).

2. For clinical use, the prophylaxis paste should be tested with teeth of patient to find the suitable condition, and the complication of prophylaxis paste containing mixed polishing agents, should be explored in more detail. In order to get a better formulation.
