นริชญ์ ชุมจัน : เรณวิทยาของพืชชายเลนในประเทศไทย. (PALYNOLOGY OF MANGROVE FLORA IN THAILAND) อ.ที่ปรึกษาวิทยานิพนธ์หลัก : ผศ. ดร. ชุม - พล คุณวาสี, 171 หน้า.

ศึกษาเรณุและสปอร์พืชชายเลนในประเทศไทย 60 สกุล 80 ชนิด 37 วงศ์ ที่ผ่านกระบวนการเคมีอะซิโตไดริช โดยศึกษาสัณฐานวิทยาของเรณุและสปอร์ด้วยกล้องจุลทรรศน์ แบบใช้แสงและกล้องจุลทรรศน์อิเล็กตรอนแบบส่องการดู สามารถแบ่งรูปแบบเรณุ และสปอร์ ออกได้ 53 รูปแบบ และ 22 รูปแบบย่อย ตามลักษณะของเปิด ขนาด รูปร่าง และลวดลายบนผิวเรณุและสปอร์

แม้ว่าความสัมพันธ์ระหว่างลักษณะของเทคโนโลยีกับปัจจัยทางกายภาพในป่าชายเลนนั้นยังไม่ชัดเจน แต่ผลจากการศึกษานี้ ชี้ให้เห็นว่าเรณุของพืชชายเลนมีลักษณะของเทคโนโลยี ค่อนข้างปิด นอกจากนี้รูปวิธีงานจำแนกรูปแบบเรณุ และสปอร์ คำบรรยายรูปแบบเรณุ และสปอร์แบบต่าง ๆ รวมทั้งสไลด์ถ่ายของเรณุ และสปอร์ที่ได้จากศึกษาในครั้งนี้สามารถใช้เป็นเครื่องมือ ในการระบุชนิดพืช ชายเลนในการวิเคราะห์เรณุจากตะกอนดินป่าชายเลนของประเทศไทย

KEYWORDS : PALYNOLOGY / MANGROVE FLORA / THAILAND / POLLEN / SPORE

NORAVIT CHUMCHIM : PALYNOLOGY OF MANGROVE FLORA IN THAILAND. ADVISOR : ASST. PROF. CHUMPOL KHUNWASI, Ph.D., 171 pp.

The acetolyzed pollens and spores of 60 genera and 80 species belonging to 37 families of mangrove species in Thailand have been examined by light microscope and scanning electron microscope. The pollens and spores can be divided into 53 pollen and spore types and 22 subtypes based on characteristic of apertures, size, shapes and ornamentations etc.

The correlation between tectal characteristic and abiotic factors in mangrove habitats is still obscure. But the result from this study suggests that pollen grains of mangrove species seem to have closed tectum. Moreover, the constructed key to pollen and spore types, the pollen and spore type descriptions, and permanent slides of pollen and spores can be used as a tool to identify plant species for pollen analysis of mangrove sediment in Thailand.

ACKNOWLEDGEMENTS

I would like to express my appreciation and gratitude to my thesis advisor, Assistant Professor Dr. Chumpol Khunwasi, for his assistance in the selection of the thesis problem, guidance and valuable comments throughout my study.

This research could not have been completed without the pollen materials from the following herbaria: Professor Kasin Suvatabhandhu Herbarium (BCU), The Forest Herbarium (BKF), and Prince of Songkla University Herbarium (PSU)

I would like to express my deepest thanks to Dr. Somran Suddee for his assistance to collect pollen materials from BKF.

I wish to express my sincere thanks to the thesis committees, Professor Dr. Thaweesakdi Boonkerd, Assistant Professor Dr. Manit Kidyoo, and Associate Professor Dr. Kitichate Sridith for their valuable suggestions.

I extremely grateful to all staffs and members in the Plants of Thailand Research Unit and Plant Ecology Research Unit, Department of Botany, Faculty of Science, Chulalongkorn University for their guidances, valuable publications, and assistances for a wonderful field trip.

Special thanks to Miss Jairaj Promrak and Mr. Pakorn Pasitsuparoad for their help and suggestion about photographic and computational works.

I would like to express my truly gratitude to my family and my grandmother for their eternal supports and encouragements. This work is dedicated to them.

This project was supported by the Thai government budget 2010-2011, under the Research Program on Conservation and Utilization of Biodiversity and the Center of Excellence in Biodiversity, Faculty of Science, Chulalongkorn University (CEB_M_54_2010); The Graduate Student School of Faculty of Science, Chulalongkorn University; the Development and Promotion of Science and Technology Talents Project of Thailand (DPST).

CHAPTER I

INTRODUCTION

Palynology is the study of pollen, spore and other biological materials studied by means of palynological method, including other applications (Hyde and Williams, 1944).

Pollen morphology gives an advantage for plant classification. It demonstrates the relationship in rank of families, tribes, genera and species (Erdtman, 1952). Pollen morphological study is not only provides a great wealth of plant taxonomy but also be able to apply in other branches of science, for example, aeropalynology, medical palynology, melissopalynology, and geopolynology (Erdtman, 1952, 1969).

In Thailand, mangrove forest can be found along coasts, estuaries and around islands which are in the tidal zone of southeastern, central, east coast of peninsula and west coast of peninsula (Aksornkoae *et al.*, 1992).

Because of unique ecology and floristic composition of mangrove vegetation, it is a suitable ecosystem to use palynology in tracing the history and evolution (Blasco, 1984). The reconstruction of vegetation types by means of pollen analysis can be carried out by experienced palynologists, and have enough data of pollen morphology or acetolyzed pollen slides of present day plant species. The works concerned the palynological study in mangrove sediments generally do not report pollen morphological data or propose the key. Moreover, a few palynological data of modern mangrove species which has been reported do not include all mangrove plant species in Thailand.

In Thailand, there are only some palynological studies in sediment in which pollen grains of mangrove plant species can be found (Somboon, 1998, 1990; Rugmai, 2006; Punwong, 2007). For pollen morphological study of modern mangrove plant species in Thailand, there are a few mangrove plant species in some plant families (Apocynaceae, Euphorbiaceae, Melastomataceae and Rhizophoraceae) have been done (Boonsermsuk, 1987; Chantaranothai, 1997; Kasetsinsombat, 1999; Sittha, 2007). There is not specific study of pollen and spore morphology of modern mangrove species in Thailand.

This is the first study of the mangrove pollen flora of Thailand. The results from this study had provided useful information for palynology concerned with mangrove plant species, and can be basic knowledge for applications in other branches of science.

Aims of this thesis

1. To investigate mangrove pollen flora in Thailand: to describe pollen and spore morphology, and to construct the key to pollen and spore types with their descriptions
2. To prepare the pollen and spore slides of mangrove flora in Thailand and kept in herbaria as references

CHAPTER II

LITERATURE REVIEWS

2.1 Mangrove plant definition

The word “mangrove” means both individual plant (trees or shrubs) and tropical intertidal forest. Using the term “mangrove” solely may make some confusion in context. So the combination words, such as “mangrove plant” or “mangrove forest”, should be referred. Some author use the word “mangal” to refer mangrove vegetation (Tomlinson, 1986; Hogarth, 1999, 2007; Kathiresan and Bingham, 2001).

Tomlinson (1986) categorized mangrove plants into 3 groups (Table 1) – major elements of mangal (strict or true mangroves), minor elements of mangal, and mangrove associates. First, major elements of mangal include 34 species in 9 genera and 5 families. They possess all or most the following features:

- 1) distribute exclusively in mangrove habitat,
- 2) play a major role in the structure of the community and are able to form pure stands,
- 3) adapt some morphology to mangrove environment, such as aerial roots, pneumatophore, or vivipary,
- 4) have physiological adaptations for salt exclusion and/or secretion,
- 5) taxonomically isolated from terrestrial relatives at least at the generic level, and often at the subfamily or family level.

Second, minor elements of mangrove include 20 species in 11 genera and 11 families. They are less conspicuous elements of the mangrove vegetation and unable to form pure stands. Moreover, they may occupy peripheral mangrove habitat.

Last, mangrove associates do not inhabit strict to mangrove habitat. They generally occur in transitional vegetation between mangrove and terrestrial communities, and often occur in non-mangrove habitat. Many epiphytes: ferns, orchids, and other plants can be found in the mangrove high canopy because they cannot tolerate salt. Besides, terrestrial herbs (including grass and grass-like plants), climbers,

ferns, palms, pandan and cycad are also included in the group of mangrove associates (Giesen *et al.*, 2006).

Table 1 List of major and minor elements of mangal (Tomlinson, 1986)

Family	Genus	Number of species
Major elements of mangal		
Avicenniaceae	<i>Avicennia</i>	8
Combretaceae	<i>Laguncularia</i>	1
	<i>Lumnitzera</i>	2
Palmae	<i>Nypa</i>	1
Rhizophoraceae	<i>Bruguiera</i>	6
	<i>Ceriops</i>	2
	<i>Kandelia</i>	1
	<i>Rhizophora</i>	8
Sonneratiaceae	<i>Sonneratia</i>	5
Minor elements of mangal		
Bombaceae	<i>Camptostemon</i>	2
Euphorbiaceae	<i>Excoecaria</i>	2
Lythraceae	<i>Pemphis</i>	1
Meliaceae	<i>Xylocarpus</i>	2
Myrsinaceae	<i>Aegiceras</i>	2
Myrtaceae	<i>Osbornia</i>	1
Pellicieraceae	<i>Pelliciera</i>	1
Plumbaginaceae	<i>Aegialitis</i>	2
Pteridaceae	<i>Acrostichum</i>	3
Rubiaceae	<i>Scyphiphora</i>	1
Sterculiaceae	<i>Heritiera</i>	3

Tomlinson (1986) discussed that the criterion 1 is the most significant and practical. According to criterion 1-5, the term “strict or true mangroves” of Tomlinson (1986) has different meaning from one of the other authors. The other ones refer the word “strict or true mangroves, restricted mangroves, exclusive mangroves, or core

mangroves (some authors also use the word “species” as a combination) to the plants which are mainly found in the intertidal mangrove habitat, and/or rarely elsewhere (Santisuk, 1983; Thanikaimoni, 1987; Hogarth, 1999, 2007; Silva and Santos, 2009). So the word “true mangroves” should comprise both Tomlinson (1986)’s major and minor elements of mangal. The meaning of the word “mangrove associates” is concordant between every author. However, some author also use the word “non-exclusive mangrove species, peripheral mangrove species, or non obligatory mangrove species” as the word “mangrove associates” (Thanikaimoni, 1987; Hogarth, 1999, 2007; Silva and Santos, 2009).

In this report, the term “true mangrove species” is applied to the plants which are mainly found in the intertidal mangrove habitat, and/or rarely elsewhere. The term “mangrove associates” is the plants which generally occur in the transitional vegetation between mangrove and terrestrial communities, and often occur in non-mangrove habitat as well.

2.2 The study of mangrove flora in Thailand

A total of 268 plant species have been recorded in Southeast Asian mangrove vegetation, including 129 trees and shrubs, 50 terrestrial herbs (including 27 grasses and grass-like plants), 28 climbers, 28 epiphytes, 24 ferns, seven palms, one pandan and one cycad. Of these 268 species, 52 are true mangrove species. Furthermore, 186 out of 268 species, as well as 33 true mangrove species occur in Thailand (Giesen *et al.*, 2006).

In Thailand, Santisuk (1983) reported that there are 53 genera and 74 species belonging to 35 families of trees and shrubs in the mangrove formation of Thailand.

Moreover, 18 species of epiphytic and lithophytic orchids were found in mangrove forests of Songkhla, Satun, Phuket, Phangnga, Krabi, and Chantaburi. None of them are true mangrove species (Sahavacharin, Boonkerd, and Patanaponpaiboon, 1979).

By reconciling the meaning of the term “true mangrove species”, checklist of Santisuk (1983) and Giesen *et al.* (2006), 17 genera and 32 species belonging to 12 families of true mangrove species in Thailand were recognized as presented in Table 2.

Table 2 List of true mangrove species of Thailand

2.3 Previous palynological works on modern mangrove plants

There are few works which directly related to the palynological works on the modern mangrove plants. The following reports are the most relevant works to this research.

Wright (1977, cited in Tomlinson, 1986: 142-144) studied North Queensland mangrove pollen flora. He studied pollen of many common genera of the Old World mangroves, and he also constructed the key to major pollen groups.

Bertrand (1983) described pollen morphology of four common New World mangroves in Jamaica: *Rhizophora mangle* L. (Rhizophoraceae), *Avicennia germinans* (L.) L. (Avicenniaceae), *Conocarpus erectus* L. and *Laguncularia racemosa* (L.) Gaertn. f. (Combretaceae). Pollen grains were studied both light and scanning electron microscopy. Pollen grains of these species are common in peat cores taken from such deposits. After these four species were studied in pollen morphology, the identification of pollen grains in the sediment is easier. However, pollen fossil materials of *Rhizophora mangle* and *Laguncularia racemosa* were hard to distinguished. Pollen of *Conocarpus erectus* and *Rhizophora mangle* can be easily found in high quantity in pollen diagrams because these plant species produce many pollen grains and probably are anemophilous plants.

Thanikaimoni (1987) studied pollen and spore morphology of mangrove plants around the world. This work used only light microscopy to study the pollen and spore morphology, so some characters might be misinterpreted. However, this work is one of the useful references for many mangrove palynologists because a number of mangrove species (both core or true mangroves and peripheral mangroves) were studied in pollen and spore morphology, and many pollen and spore photographs as well as a key to the mangrove pollen and spore were presented in this publication.

The pollen grains of 40 species of Chinese mangrove plants and of 3 species of Loranthaceae in mangrove were palynologically studied using light and scanning electron microscope (Liu and Tang, 1989). It was found that the pollen grains of Rhizophoraceae, Sonneratiaceae and some other species such as *Aegiceras corniculatum*, *Avicenna marina*, *Acanthus ebracteatus*, *Acrostichum aureum* etc. demonstrate a function which could be used to identify stratum.

Das and Ghose (1990) described pollen morphology of the mangrove flora of the Sundarbans, West Bengal. Pollen of 30 species from 20 genera and 15 families were palynologically studied by light and scanning electron microscope. A key to the pollen grains was presented.

Silva and Santos (2009) studied pollen morphology of the shrub and arboreal flora of mangroves of Northeastern Brazil. Pollen morphology of fourteen species belonging to seven families was light and scanning electron microscopic studied. The pollens of all species were described and illustrated in that first atlas of the pollen flora of the Brazilian mangroves.

CHAPTER III

MATERIALS AND METHODS

3.1 Materials for field work and sample collection

- 1) Paper envelopes
- 2) A plant press, size 30X46 cm
- 3) A pair of hand pruners
- 4) Plastic bags
- 5) Hand-lens
- 6) Collector's number cards

3.2 Materials for slide preparation and pollen and spore morphological study

- 1) 10% Potassium hydroxide
- 2) Glacial acetic acid
- 3) Acetic acid anhydride
- 4) Concentrated sulfuric acid
- 5) 70%, 90%, and absolute ethyl alcohol
- 6) Distilled water
- 7) Benzene
- 8) Silicone oil AK 2,000
- 9) Paraffin wax
- 10) Immersion oil
- 11) Label stickers
- 12) Vials 1 dram
- 13) Sieving crucible
- 14) Beakers 50 ml and 100 ml
- 15) Glass rods
- 16) Hot plate
- 17) Warm plate
- 18) Centrifuge and centrifuge tubes

- 19) Vortex mixer
- 20) Microscope slides and cover glasses
- 21) Stage micrometer
- 22) Light microscope (LM) OLYMPUS model CH30 and NIKON model ECLIPSE E200 equipped with digital camera unit Nikon DS-Fi1
- 23) Scanning electron microscope (SEM) JEOL model JSM 5410 LV

3.3 Field work and sample collection

The pollens and spores of 60 genera and 80 species belonging to 37 families of mangrove species in Thailand has been examined (Table 3). Mature floral buds and spores were obtained from voucher specimens deposited at BCU (Professor Kasin Suvatabhandhu Herbarium, Department of Botany, Chulalongkorn University, BKF (The Forest Herbarium), PSU (Prince of Songkla University Herbarium), as well as specimens collected from field collection.

Field collection for herbarium specimens, as well as pollen and spore materials were made throughout the coasts of Thailand during 2009 to 2010. Mature flower buds of each species were kept and dried in paper envelopes. Vouchers plant specimens were kept at BCU and PSU.

3.4 Pollen and spore preparation for LM and SEM microscopy, and pollen and spore morphological study

First, pollens and spores were acetolyzed using the method adapted from the acetolysis method (Erdtman, 1960) as follow:

- 1) Boiled in 10% potassium hydroxide until reach boiling point
- 2) Washed pollen and spore residues with distilled water 3 times
- 3) Used glacial acetic acid to remove water
- 4) Removed organic matter with acetolysis mixture (9 vols. of chemically pure acetic anhydride and 1 vol. concentrated sulfuric acid) by boiling in water bath at 70°C for 30-60 seconds
- 5) Washed with glacial acetic acid
- 6) Washed with distilled water 3 times.

7) Dehydrated in an ethanol series (70%, 90% and absolute)

Note: At the end of each step, pollens and spores were centrifuged at 3,600 rpm.

For light microscopy, acetolyzed pollens and spores were suspended in benzene. Silicone oil was then added as a mounting medium (Anderson, 1980), then slides sealed with paraffin wax. Permanent slides of all species were deposited at BCU.

Measurements and morphological observations were taken under LM (OLYMPUS model CH3). All species were taken photographs using LM (NIKON model ECLIPSE E200). All measurements were based on at least 10 pollen grains.

For scanning electron microscopy, acetolyzed pollens and spores were suspended in absolute ethyl alcohol. Pollen and spore samples were dehydrated by critical-point-drying method (CPD) then mounted on stubs and coated with gold-palladium. Pollen and spore were studied and photographs were taken by scanning electron microscope (JEOL JSM 5410 LV)

Pollen and spore morphology was generally observed both polar view and equatorial view (figure 1). Moreover, pollen and spore wall stratification was observed as well (except intine and endospore which are not acetolysis resistant structures) (figure 2).

Pollen and spore morphology was divided into pollen and spore types. Eventually, key to pollen and spore type and each type description were then constructed.

The terminology used in this study is a combination of those used by Erdtman (1952), Punt *et al.* (2007) and Hesse *et al.* (2009). The plant classification adopts Angiosperm Phylogeny Group classification system (APG III, 2009).

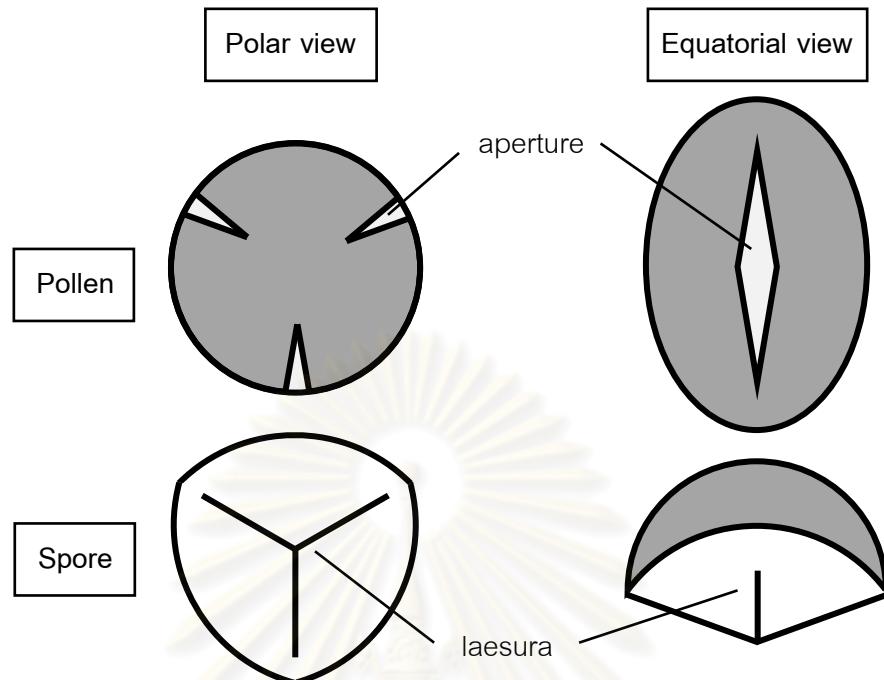

Figure 1 Pollen and spore on polar view and equatorial view (pictures redrawn from Punt et al. (2007))

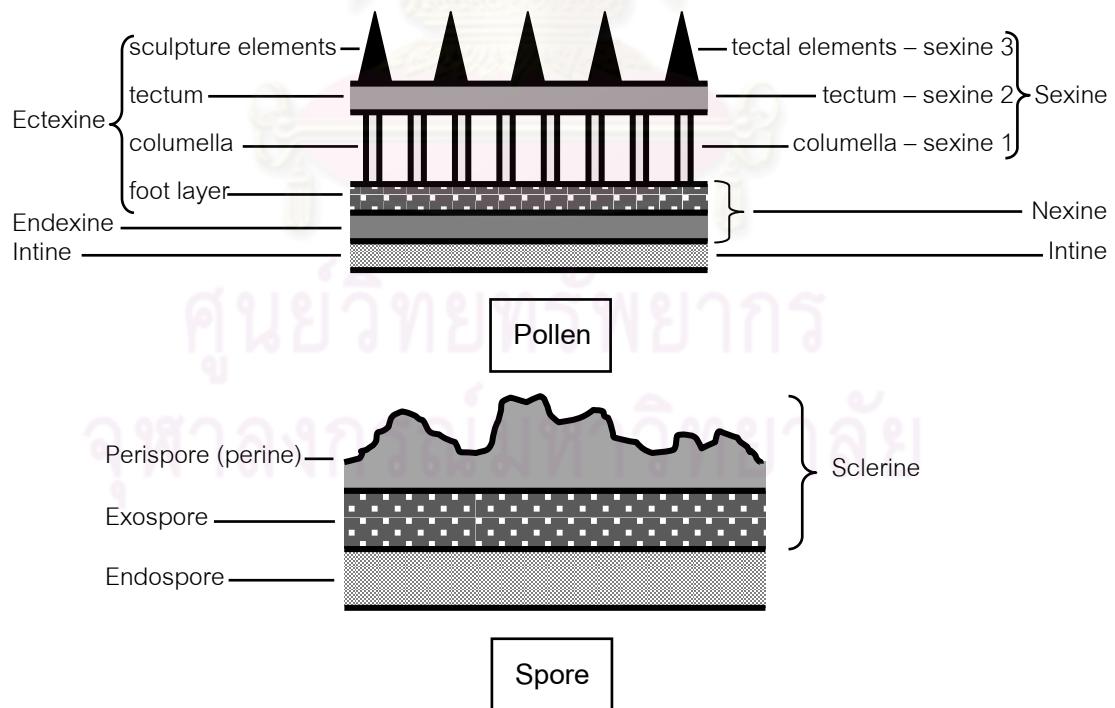

Figure 2 Diagram of pollen and spore wall stratification (pictures redrawn from Punt et al. (2007))

Table 3 List of the investigated specimens

Species	Families	Collection	Herbarium
<i>Acanthus ebracteatus</i> Vahl*	ACANTHACEAE	Muang, Songkhla/ N. Chumchim 0032/ 15 Apr. 2010	BCU**, PSU**
<i>Acanthus ilicifolius</i> L.*	ACANTHACEAE	Tung Wah, Satun/ N. Chumchim 0049/ 25 Apr. 2010	BCU**
<i>Acanthus volubilis</i> Wall.*	ACANTHACEAE	Muang, Ranong/ Pipat s.n./ 6 Feb. 1982	BKF
<i>Acrostichum aureum</i> L.	PTERIDACEAE	Tarutao Island, Satun/ Gordon Congdon 263/ 10-11 Jan. 1980	PSU
<i>Acrostichum speciosum</i> Willd.*	PTERIDACEAE	Wang Krachae, Trat/ N. Chumchim 0012/ 21 Nov. 2009	BCU**
<i>Aegialitis rotundifolia</i> Roxb.*	PLUMBAGINACEAE	Tarutao Island, Satun/ Congdon C937/ 3 Jul. 1981	PSU
<i>Aegiceras corniculatum</i> (L.) Blanco*	PRIMULACEAE	Wang Krachae, Trat/ N. Chumchim 0021/ 22 Nov. 2009	BCU**
<i>Aglaia cucullata</i> (Roxb.) Pellegr.	MELIACEAE	La-oon, Ranong/ Pipat & Thawatchai 3479/ 2 Nov. 1981	BKF
<i>Allophylus cobbe</i> (L.) Raeusch.	SAPINDACEAE	Satingpra, Songkhla/ P. Sirirugsa 831/ 26 May 1984	PSU
<i>Antidesma ghaesembilla</i> Gaertn.	PHYLLANTHACEAE	Pak Payoon, Phatthalung/ N. Chumchim 0044/ 17 Apr. 2010	BCU**
<i>Ardisia elliptica</i> Thunb.	PRIMULACEAE	Tepa, Songkhla/ J.F. Maxwell 85- 740/ 20 Jul. 1985	PSU
<i>Atalantia monophylla</i> DC.	RUTACEAE	Haad Yai, Songkhla/ J.F. Maxwell 84-531/ 17 Dec. 1984	PSU

CHAPTER IV

RESULTS

There is a considerable variation of pollen and spore morphology of mangrove flora in Thailand (Table 4). The keys contructed in this study are dichotomous. All characters used in these keys can be observed under LM. However, the characters from scanning electron microscope investigation were used as an option and used in the keys to subtypes of each pollen and spore type in case of hardly discriminant using LM.

4.1 Keys to pollen and spore types

4.1.1 Key for spore

- | | | |
|----|---|------------------------------------|
| 1a | Trilete spore..... | <i>Acrostichum speciosum</i> type |
| 1b | Monolete spore..... | 2 |
| 2a | Surface with small globules or mass of particles..... | <i>Lecanopteris sinuosa</i> type |
| 2b | Grain echinate, gemmate, verrucate, or short baculate..... | 3 |
| 3a | Grain echinate, echinae slender with point end (base width about 1 µm); interspinal area granulate to finely verrucate..... | <i>Drynaria quercifolia</i> type |
| 3b | Grain echinate (echinae base width generally more than 5 µm), gemmate, or verrucate..... | 4 |
| 4a | Grain densely gemmate and verrucate, gemmae and verrucae different in size; or echinate, spine shape conical with point end, some grains spines form like large gemmae, interspinal area gemmate..... | <i>Pyrrosia adnascens</i> type |
| 4b | Grain fairly verrucate or short baculate, present only on distal surface..... | <i>Stenochlaena palustris</i> type |

4.1.2 Key for pollen

- | | | |
|----|---------------------------------------|----|
| 1a | Simple aperturate pollen grain..... | 2 |
| 1b | Compound aperturate pollen grain..... | 17 |
| 2a | Grain porate..... | 3 |

2b	Grain colpate.....	8
3a	Grain 1-porate.....	4
3b	Grain 2-3-porate or polyantoporate.....	5
4a	Ornamentation perforate; annulus present.....	<i>Flagellaria indica</i> type
4b	Ornamentation granulate (LM); annulus absent.....	<i>Pandanus odoratissimus</i> type
5a	Grain 2-porate.....	<i>Ficus microcarpa</i> type
5b	Grain 3-zonoporate or polyantoporate.....	6
6a	Grain polyantoporate.....	<i>Suaeda maritima</i> type
6b	Grain 3-zonoporate.....	7
7a	Ornamentation microreticulate (LM).....	<i>Allophylus cobbe</i> type
7b	Ornamentation gemmate (LM).....	<i>Sonneratia griffithii</i> type
8a	Grain 1-colpate.....	9
8b	Grain 2-3-colpate.....	11
9a	Ring-like aperturate grain	<i>Nypa fruticans</i> type
9b	Aperture others.....	10
10a	Equatorial outline triangular with flat-top on longer equatorial view, and slightly quadrangular on shorter equatorial view	<i>Horsfieldia irya</i> type
10b	Equatorial outline circular-elliptic to elliptic.....	<i>Phoenix paludosa</i> type
11a	Grain 2-colpate.....	<i>Crinum asiaticum</i> type
11b	Grain 3-colpate.....	12
12a	Apertures fused at polar ends, 3-parasyncolpate.....	<i>Barringtonia racemosa</i> type
12b	Aperture not fused, 3-zonocolpate.....	13
13a	Ornamentation long gemmate and clavate (LM).....	<i>Aegialitis rotundifolia</i> type
13b	Ornamentation others.....	14
14a	Ornamentation granulate (LM).....	<i>Clerodendrum inerme</i> type
14b	Ornamentation others.....	15
15a	Ornamentation perforate (LM).....	<i>Sesuvium portulacastrum</i> type
15b	Ornamentation others.....	16
16a	Colpi relatively narrow or slit-like (0.40-2.40 μm)	<i>Acanthus volubilis</i> type
16b	Colpi relatively wide (6.00-9.40 μm).....	<i>Dolichandrone spathacea</i> type
17a	Heterocolpate.....	18

17b Not heterocolpate.....	21
18a Colpori ectoaperture very short, half length of polar axis; fossulate-perforate on subsidiary colpi (SEM).....	<i>Calycopteris floribunda</i> type
18b Colpori ectoaperture slightly shorter than polar axis; granules present on subsidiary colpi (SEM).....	19
19a Ornamentation perforate (LM).....	<i>Lumnitzera littorea</i> type
19b Ornamentation psilate (LM).....	20
20a Endoapertures with acute equatorial ends, sometimes equatorial ends diffused; ornamentation psilate with very small round depressions, or with sparsely minute puncta (SEM).....	<i>Melastoma saigonense</i> type
20b Endoapertures with obtuse equatorial ends; ornamentation rugulate with scattered minute puncta (SEM).....	<i>Terminalia catappa</i> type
21a Grain colpororate.....	<i>Scyphiphora hydrophyllacea</i> type
21b Grain colporate.....	22
22a Grain polypantocolporate.....	<i>Thespisia populnea</i> type
22b Grain 3-5-colporate.....	23
23a Grain 4-5-colporate.....	24
23b Grain 3-colporate.....	28
24a Ornamentation microreticulate to finely reticulate (LM).....	<i>Glochidion littorale</i> type
24b Ornamentation others.....	25
25a Endoaperture protruding beyond ectoaperture.....	<i>Pemphis acidula</i> type
25b Endoaperture not protruding beyond ectoaperture.....	26
26a Endoaperture circular or subcircular.....	<i>Xylocarpus rumphii</i> type
26b Endoaperture lalongate elliptic.....	27
27a Equatorial outline elliptic to circular-elliptic.....	<i>Atalantia monophylla</i> type
27b Equatorial outline oblong-elliptic with round polar ends...	<i>Planchonella obovata</i> type
28a Ectoapertures fused at polar ends, 3-parasyncolporate.....	<i>Melaleuca cajuputi</i> type
28b Ectoaperture not fused or some grains 1 pair of ectoapertures fused at pole.....	29
29a Ornamentation echinate (LM).....	<i>Pluchea indica</i> type
29b Ornamentation others	30
30a Ornamentation reticulate, lumina wide (LM).....	31

- 30b Ornamentation finely reticulate or others (LM).....33
- 31a Polar outline triangular; shape class oblate to oblate spheroidal; colpus membrane perforate to microreticulate.....*Caesalpinia crista* type
- 31b Polar outline circular to circular-triangular; shape class oblate spheroidal to subprolate; colpus membrane granulate.....32
- 32a Ectoaperture colpi, shape irregular or polygonal-oblong; endoaperture pori, shape irregular or polygonal, not protruding.....*Intsia bijuga* type
- 32b Ectoaperture colpi, oblong-elliptic, margin regular; endoaperture pori, lalongate elliptic or subcircular, protruding.....*Peltophorum pterocarpum* type
- 33a Ornamentation on apocolpia different from ornamentation on mesocolpia (LM)...34
- 33b Ornamentation on apocolpia indifferent from ornamentation on mesocolpia (LM).35
- 34a Equatorial outline circular or subcircular; ornamentation perforate; granulate or granulate-perforate on mesocolpia (LM).....*Cerbera manghas* type
- 34b Equatorial outline oblong-elliptic with round polar ends; ornamentation psilate on mesocolpia; microreticulate on apocolpia (LM).....*Aglaia cucullata* type
- 35a Ornamentation microreticulate or finely reticulate (LM).....36
- 35b Ornamentation granulate, psilate, or perforate (LM).....43
- 36a Costa absent.....*Avicennia alba* type
- 36b Costa present.....37
- 37a Equatorial outline oblong-elliptic.....*Antidesma ghasembilla* type
- 37b Equatorial outline circular to elliptic.....38
- 38a Grain small, $P=11.50-17.20 \mu\text{m}$; endoaperture not wide open, endoaperture polar width 1.00-2.00 μm39
- 38b Grain small to medium sized, $P=15.80-30.20 \mu\text{m}$; if $P<17.20 \mu\text{m}$ endoaperture more wide open, endoaperture polar width 2.80-8.20 μm40
- 39a Ectoaperture polar ends obtuse.....*Ardisia elliptica* type
- 39b Ectoaperture polar ends acute.....*Scolopia macrophylla* type
- 40a Endoaperture lalongate elliptic or lalongate oblong, equatorial ends obtuse, generally wide open.....*Derris trifoliata* type
- 40b Endoaperture lalongate elliptic or lalongate oblong, equatorial ends acute or diffused, somewhat endocingula present.....41

- 41a Columellae invisible under LM.....*Calophyllum inophyllum* type
- 41b Columellae distinct, clearly seen on both surface view and optical section.....42
- 42a Grain planaperturate; equatorial outline circular-elliptic...*Excoecaria agallocha* type
- 42b Grain not planaperturate; equatorial outline elliptic*Shirakiopsis indica* type
- 43a Ectoaperture relatively short, length<2/3 of polar axis.....44
- 43b Ectoaperture as long as or slightly shorter than polar axis.....46
- 44a Endoaperture lalongate oblong-elliptic.....*Dalbergia candenatensis* type
- 44b Endoaperture circular or subcircular.....45
- 45a Equatorial outline elliptic to circular-elliptic; endoaperture protruding beyond ectoaperture.....*Pemphis acidula* type
- 45b Equatorial outline circular or subcircular; endoaperture not protruding beyond ectoaperture.....*Xylocarpus rumphii* type
- 46a Columellae distinct, clearly seen on both surface view and optical section, polygonal or rarely circular when see on surface view.....*Scaevola taccada* type
- 46b Columellae indistinct.....47
- 47a Ornamentation granulate (LM).....*Heritiera littoralis* type
- 47b Ornamentation psilate (LM).....48
- 48a Endoaperture protruding beyond ectoaperture; equatorial outline circular or subcircular.....*Cynometra ramiflora* type
- 48b Endoaperture not protruding beyond ectoaperture, or rarely protruding; equatorial outline elliptic if endoaperture protruding49
- 49a Equatorial outline oblong-elliptic with round polar ends; endoaperture lalongate elliptic, endocingula absent.....*Planchonella obovata* type
- 49b Equatorial outline Circular to elliptic, or oblong-elliptic; endocingulum present if equatorial outline oblong-elliptic.....50
- 50a Grain medium sized, P=33.20-39.20 μm*Diospyros areolata* type
- 50b Grain very small to small, P=9.50-21.20 μm*Ceriops decandra* type

4.2 Descriptions of pollen types

4.2.1 *Acanthus volubilis* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar or subisopolar
P/E ratio:	(1.31)-1.62-(2.14)
Shape class:	Subprolate to perprolate
Size class:	Small to medium sized $P=(25.50)-36.58-(44.60) \mu\text{m}$, $E=(17.00)-23.01-(30.40) \mu\text{m}$
Polar area index:	(0.20)-0.34-(0.51)
Polar outline:	Triangular to circular-triangular
Equatorial outline:	Elliptic to elliptic-oblong with straight or slightly concave sides, some grains more tapering toward one pole
Apertures:	Colpi, slightly shorter than polar axis, (21.50)-28.92-(37.40) X (0.40)-1.16-(2.40) μm , narrow or slit-like, margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; costa colpi present, some grains costae indistinct.
Exine:	Semitectate; exine thickness (1.20)-2.15-(2.80) μm ; sexine thicker than nexine; columellae simplicolumellate, distinct, clearly seen on both surface view and optical section, columellae circular when seen on surface view.
Ornamentation:	Microreticulate to reticulate (LM). Microreticulate, reticulate or perforate (SEM).
Included taxa:	<i>Acanthus ebracteatus</i> Vahl – เหงือกปลาหมอดอกขาว; เหงือกปลาหมอ (กลาง); แก้มหมอ (ACANTHACEAE) (Plate 1 A-J)

Acanthus ilicifolius L. – เหงือกปลาหมอดอกม่วง; แก้มหมอ, แก้มหมอเล (กระปี); นางเกรียง, จะเกรียง, อีเกรียง (กลาง); เหงือกปลาหมอ, เหงือกปลาหมอน้ำเงิน (ท้าวไป) (ACANTHACEAE) (Plate 2 A-J)

Acanthus volubilis Wall. – เหงือกปลาหมอเครื่อ (ACANTHACEAE)
(Plate 3 A-J)

Key to subtypes:

- 1a Ornamentation reticulate, lumina irregular in size and shape, polygonal and oblong, heterobrochate; simplicolumellate (LM); muri smooth, narrower at the top and sudden broader below; margo present, psilate at the innermost, aroured by reticulate with discontinuous muri (SEM); colpus membrane psilate.....*Acanthus ilicifolius* subtype
- 1b Ornamentation perforate or microreticulate.....2
- 2a Ornamentation perforate or microreticulate; tectum or muri surface uneven granulate, lumina irregular in size and shape (SEM); opercula present, perforate to microreticulate with smooth surface, some grains opercula indistinct.....*Acanthus ebracteatus* subtype
- 2b Ornamentation microreticulate (LM); muri smooth, ridges at the top, lumina regular, more or less in circular outline, narrower to the base (SEM); colpus membrane granulate.....*Acanthus volubilis* subtype

4.2.2 *Acrostichum speciosum* type

Spore class:	Trilete
Dispersal unit:	Monad
Polarity:	Heteropolar
P/E ratio:	(0.58)-0.73-(0.85)
Shape class:	Oblate to suboblate
Size class:	Medium sized to large $P=(28.20)-39.56-(48.00) \mu\text{m}$, $E=(48.40)-53.80-(60.20) \mu\text{m}$
Arm length/radius:	(0.48)-0.61-(0.77)
Shape:	Tetrahedral to tetrahedral-globose
Laesura:	Trilete, indistinct; arm size (0.80)-1.50-(2.80) X (12.50)-16.96-(22.00) μm .

Sclerine: Sclerine thickness (1.40)-2.04-(2.50) μm ; perine thicker or thinner than exospore.

Ornamentation: Granulate (LM). Finely granulate with rodlets attached to the surface both proximal and distal surface, or densely granulate on both proximal and distal surface, granules different in size (SEM).

Included taxa: *Acrostichum aureum* L. – ปรางทอง, ปรางไช่, ปรางใหญ่; ปรางทะเล (กลาง, ใต้); ปีโย (มลายู-สหุล) (PTERIDACEAE) (Plate 4 A-J)

Acrostichum speciosum Willd. – ปรางหนู (ชุมพร, ตราด); ปราง (กลาง, สมุทรสาคร) (PTERIDACEAE) (Plate 5 A-J)

Key to subtypes:

- 1a Ornamentation densely granulate on both proximal and distal surface, granules different in size.....*Acrostichum aureum* subtype
- 1b Ornamentation finely granulate with rodlets attached to the surface both proximal and distal surface.....*Acrostichum speciosum* subtype

4.2.3 *Aegialitis rotundifolia* type

Pollen class: 3-colporate

Dispersal unit: Monad

Polarity: Isopolar

P/E ratio: (0.62)-0.74-(0.95)

Shape class: Oblate to oblate spheroidal

Size class: Medium sized to large

$P=(40.00)-46.11-(49.80) \mu\text{m}$, $E=(52.00)-63.26-(74.20) \mu\text{m}$

Polar area index: (0.10)-0.17-(0.22)

Polar outline: Triangular with convex sides to circular-triangular

Equatorial outline: Elliptic to circular-elliptic

Apertures: Colpi, slightly shorter than polar axis, (32.00)-39.48-(53.40) X (4.30)-7.13-(11.50) μm , wide, margin distinct, widen at equator

and tapering toward poles, polar ends acute or obtuse; colpus membrane granulate to gemmate.

- Exine: Tectate imperforate; exine thickness (7.40)-8.48-(10.00) μm ; sexine thicker than nexine; columellae distinct, clearly seen on optical section.
- Ornamentation: Long gemmate or clavate (LM) with fossulate-granulate terminal sculpturing, granules and finely gemmae present on tectum surface.
- Included taxa: *Aegialitis rotundifolia* Roxb. – ใบพาย (กลาง, เหนือ); แสม (กลาง, ใต้) (PLUMBAGINACEAE) (Plate 6 A-J)

4.2.4 *Aglaia cucullata* type

- Pollen class: 3-colporate
- Dispersal unit: Monad
- Polarity: Isopolar
- P/E ratio: (1.23)-1.52-(1.70)
- Shape class: Subprolate to prolate
- Size class: Small
 $P=(17.00)-18.27-(19.80) \mu\text{m}$, $E=(10.80)-12.09-(15.00) \mu\text{m}$
- Polar area index: (0.66)-0.76-(0.84)
- Polar outline: Triangular with straight to convex sides
- Equatorial outline: Oblong-elliptic with round polar ends
- Apertures: Ectoapertures – colpi, very short, about one third of polar axis, (5.20)-6.27-(7.50) X (0.30)-0.45-(0.60) μm , very narrow or slit-like, margin distinct, polar ends acute; colpus membrane granulate. Endoapertures – pori, lalongate elliptic, (2.00)-2.41-(2.80) X (3.00)-3.77-(5.00), margin distinct; costa endopori present.
- Exine: Tectate perforate; exine thickness (0.80)-1.14-(1.40) μm ; sexine thicker than nexine; columella invisible under LM.
- Ornamentation: Psilate on mesocolpia; microreticulate on apocolpia (LM). Psilate with sparsely perforate on mesocolpia, puncta circular, smaller

than 0.5 μm ; bimicroreticulate on apocolpia, lumina irregular in size and shape; heterobrochate (SEM).

Included taxa: *Aglaia cucullata* (Roxb.) Pellegr. – แคงน้ำ (ใต้, เหนือ); ตาเสือ (กลาง, นครศรีธรรมราช); แสมแดง (ชุมพร, ใต้) (MELIACEAE) (Plate 7 A-J)

4.2.5 *Allophylus cobbe* type

Pollen class:	3-porate
Dispersal unit:	Monad
Polarity:	Isopolar or some subisopolar
P/E ratio:	(0.61)-0.70-(0.78)
Shape class:	Oblate to suboblate
Size class:	Small to medium sized $P=(16.00)-18.42-(20.00) \mu\text{m}$, $E=(24.70)-26.26-(29.20) \mu\text{m}$
Polar area index:	-
Polar outline:	Triangular with slightly convex to slightly concave sides; angulaperturate
Equatorial outline:	Rhomboidal elliptic to elliptic
Apertures:	Pori, lolongate elliptic, lalongate elliptic or subcircular, (3.50)-4.53-(5.30) X (2.80)-4.01-(5.60) μm .
Exine:	Tectate perforate; exine thickness (1.00)-1.30-(2.00) μm ; sexine thicker than nexine; columellae obscure.
Ornamentation:	Microreticulate (LM). Rugulate-microreticulate, lumina irregular in size and shape, usually polygonal, decreasing in size toward apertures (SEM).
Included taxa:	<i>Allophylus cobbe</i> (L.) Raeusch. – ต่อไส้ (กลาง, เหนือ); จ้าตอง (ลำพูน); ตานหไมย (กาญจนบุรี, เหนือ); ตาลอีลีน (สระบุรี); เพี้ยฟาน (เชียงใหม่, เหนือ) (SAPINDACEAE) (Plate 8 A-J)

4.2.6 *Antidesma ghaesembilla* type

Pollen class:	3-colporate
Dispersal unit:	Monad

Polarity:	Isopolar
P/E ratio:	(1.54)-1.69-(1.92)
Shape class:	Prolate
Size class:	Small $P=(17.00)-18.66-(21.60) \mu\text{m}$, $E=(10.20)-11.07-(12.40) \mu\text{m}$
Polar area index:	(0.16)-0.23-(0.33)
Polar outline:	Triangular to slightly trilobate
Equatorial outline:	Oblong-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (14.00)-15.92-(17.80) X (0.40)-0.70-(1.20) μm , margin distinct, narrow, slightly widen at equator and gradually tapering toward poles, polar ends acute; colpus membrane granulate; costa ectocolpi present. Endoapertures – colpi, lalongate elliptic to lalongate oblong with acute equatorial ends, (1.00)-1.65-(2.20) X (4.50)-6.03-(7.00) μm , margin distinct; costa endocolpi present.
Exine:	Semitectate; exine thickness (1.00)-1.38-(1.80) μm ; sexine as thick as or thinner than nexine; columellae present, clearly seen on optical section, indistinct on surface view.
Ornamentation:	Microreticulate (LM). Striate-microreticulate, lumina oblong-elliptic to oblong (SEM).
Included taxa:	<i>Antidesma ghaesembilla</i> Gaertn. – เม่าไก่ป่า (ชลบุรี); กูแจ (มลายู-นราธิวาส); ชะเม่าพา (ตะวันออกเฉียงเหนือ); มะเม่า (ตราด, สตูล); มะเม่าข้าวเปีย (ชุมพร); มังเม่า (จันทบุรี); เม่าทุ่ง (ชุมพร, สงขลา) (PHYLLANTHACEAE) (Plate 9 A-J)

4.2.7 *Ardisia elliptica* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.92)-1.02-(1.14)
Shape class:	Oblate spheroidal to subprolate

Size class:	Small
	P=(11.50)-12.48-(13.20) μm , E=(10.80)-12.26-(13.40) μm
Polar area index:	(0.30)-0.34-(0.41)
Polar outline:	Circular to triangular-circular
Equatorial outline:	Circular to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (8.80)-9.61-(10.80) X (1.80)-2.04-(2.40) μm , margin indistinct, widen at equator and tapering toward poles, polar ends obtuse; colpus membrane with angular granules; costa ectocolpi present. Endoapertures – colpi, lalongate oblong with diffused equatorial ends, (1.00)-1.69-(2.00) X (4.20)-4.66-(5.20) μm , margin indistinct.
Exine:	Semitectate; exine thickness (1.00)-1.16-(1.40) μm ; sexine as thick as or thiner than nexine; columella invisible under LM.
Ornamentation:	Microreticulate (LM). Microreticulate, lumina polygonal, irregular in size and shape; heterobrochate; muri distinctly ridged, broader below (SEM).
Included taxa:	<i>Ardisia elliptica</i> Thunb. – รามไหญี่, ทุลังกาสา (ชุมพร); ลังพิสา (ตราด); ปีอนา (มลายู-นราเชิงว้าส) (PRIMULACEAE) (Plate 10 A-J)

4.2.8 *Atalantia monophylla* type

Pollen class:	4(-5)-porate
Dispersal unit:	Monad
Polarity:	Isopolar or heteropolar
P/E ratio:	(1.08)-1.14-(1.23)
Shape class:	Prolate spheroidal to subprolate
Size class:	Small
	P=(20.20)-22.43-(24.20) μm , E=(17.40)-19.64-(21.20) μm
Polar area index:	(0.30)-0.34-(0.38)
Polar outline:	Circular to circular-tetrangular, or circular-pentangular
Equatorial outline:	Elliptic to circular-elliptic

Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (13.40)-15.80-(19.00) X (1.20)-1.68-(2.20) μm , margin distinct, slightly widen at equator and tapering toward poles, polar ends acute or obtuse; colpus membrane granulate; costa ectocolpi present. Endoapertures – colpi, lalongate elliptic, sometimes equatorial ends diffused, (2.00)-2.39-(2.80) X (4.00)-5.30-(6.20) μm , margin distinct, some grains endoapertures slightly situated above or below equatorial plane; costa endocolpi present, somewhat indistinct.
Exine:	Tectate perforate; exine thickness (1.00)-1.51-(1.80) μm ; sexine thicker than nexine; columellae distinct, clearly seen on surface view than on optical section, distinct when seen on apocolpium surface.
Ornamentation:	Psilate (LM). Fossulate with scattered minute puncta, puncta smaller than 0.5 μm (SEM).
Included taxa:	<i>Atalantia monophylla</i> DC. – มะนาวผี (เชียงใหม่, ราชบุรี); กรุดเบรีย (เขมร, จันทบุรี); กรุดฟี (สุราษฎร์ธานี); กะนาวพลี (ใต้); ปีติ้ว (เชียงใหม่, เชียงราย); จำลิว (เหนือ); นางกาน (ขอนแก่น); มะลิว (เชียงใหม่) (RUTACEAE) (Plate 11 A-J)

4.2.9 *Avicennia alba* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.85)-1.00-(1.27)
Shape class:	Suboblate to subprolate
Size class:	Small to medium sized $P=(21.20)-25.01-(36.00) \mu\text{m}$, $E=(18.00)-25.20-(36.20) \mu\text{m}$
Polar area index:	(0.09)-0.24-(0.44)
Polar outline:	Circular-triangular to circular
Equatorial outline:	Circular to circular-elliptic

Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (11.50)-19.99-(30.50) X (3.00)-8.88-(12.80) μm , wide, margin distinct, widely opened at equator and tapering toward poles, polar ends acute; colpus membrane granulate. Endoapertures – pori, circular or subcircular, or rarely lalongate elliptic, (2.50)-8.37-(12.60) X (3.40)-8.24-(11.20) μm , margin distinct.
Exine:	Tectate perforate; exine thickness (1.80)-2.26-(2.80) μm ; sexine as thick as, thinner, or thicker than nexine; columellae simplicolumellate, distinct, clearly seen optical section than on surface view.
Ornamentation:	Microreticulate or somewhat finely reticulate, lumina more or less regularly in size and shape, lumina circular and some polygonal, narrower to the base; muri smooth (LM, SEM).
Included taxa:	<i>Avicennia alba</i> Blume – แสมขาว (กลาง); พีพีเด (ตรัง); แสม (กลาง, ใต้); แหม (ใต้, ภูเก็ต); แหมเด (ใต้) (ACANTHACEAE) (Plate 12 A-J)
	<i>Avicennia marina</i> (Forssk.) Vierh. – แสมทะเด (กลาง, ปีตานี); ปีปี คำ (ภูเก็ต) (ACANTHACEAE) (Plate 13 A-J)
	<i>Avicennia officinalis</i> L. – แสมคำ, อายือปี (มาเลฯ-ปีตานี) (ACANTHACEAE) (Plate 14 A-J)
Remarks:	<p>It is difficult to divide this type into subtype because of the gradience of variation in ornamentation, pollen grain size and shape. However, it is noticeable that many pollen grains of <i>A. alba</i> have lumina increasing in size toward poles becoming reticulate. Some pollen grains of <i>A. marina</i> have an ornamentation in finely reticulate. Moreover, many pollen grains of <i>A. officinalis</i> have psilate ornamentation or very small puncta on apocolpia.</p>

4.2.10 *Barringtonia racemosa* type

Pollen class:	3-parasyncolpate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(1.07)-1.33-(1.64)
Shape class:	Prolate spheroidal to prolate
Size class:	Small to medium sized P=(31.80)-42.14-(52.60) μm , E=(24.40)-31.77-(36.60) μm
Polar area index:	-
Polar outline:	Trilobate
Equatorial outline:	Elliptic
Apertures:	Colpi – slightly shorter than polar axis, (29.80)-36.68-(49.00) X (2.50)-4.06-(7.40) μm , margin distinct, slightly widen at equator and tapering toward poles and anastomosing forming synaperturate with very small apocolpial field approximately 1 μm in diameter; margo present, distinct, psilate, appearing like narrow, wave band, one side of margo of two adjacent ectoapertures expanding above apocolpium forming a cushion-like tectum; colpus membrane granulate; costa colpi present or indistinct.
Exine:	Tectate to tectate perforate; exine thickness (1.20)-1.72-(2.60) μm ; sexine thicker than nexine; columellae distinct or indistinct, clearly seen on mesocolpium surface view; irregular in size and shape, circular or polygonal in outline.
Ornamentation:	Psilate, perforate (LM). Perforate (SEM).
Included taxa:	<i>Barringtonia asiatica</i> (L.) Kurz – ຈິກທະເລ; ຈິກເລ, ໂດນເດ (ໄຕ້); ອາມຸງ (ມລາຍຸ-ນຮາອີວາສ) (LECYTHIDACEAE) (Plate 15 A-J)

Barringtonia racemosa (L.) Spreng. – ຈິກສວນ, ຈິກບ່ານ (ກທມ.); ປູຕະ (ມລາຍຸ-ນຮາອີວາສ) (LECYTHIDACEAE) (Plate 16 A-J)

Key to subtypes:

- 1a Columellae indistinct; ornamentation perforate, pores increase in size toward aperture becoming foveolate.....*Barringtonia asiatica* subtype
- 1b Columellae distinct; ornamentation perforate, pores distribute regularly and no difference in size.....*Barringtonia racemosa* subtype

Remarks:

Acetolyzed pollen grains of *Barringtonia asiatica* subtype seem to be more shrunken than those of *Barringtonia racemosa* subtype although they were prepared with the same procedure. Sexine at apocolpal field of these two subtype pollen grains was easily detached from pollen wall.

4.2.11 *Caesalpinia crista* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.69)-0.79-(0.88)
Shape class:	Oblate to oblate spheroidal
Size class:	Medium sized to large P=(28.40)-35.69-(38.40) µm, E=(41.00)-45.14-(50.00) µm
Polar area index:	(0.13)-0.17-(0.20)
Polar outline:	Triangular; planaperturate
Equatorial outline:	Elliptic
Apertures:	Ectoapertures – colpi, as long as polar axis, (28.40)-35.69-(38.40) X (15.00)-15.94-(17.80) µm, opened as wide as misocolpium, margin distinct, widen at equator and tapering toward poles, polar ends acute or obtuse; colpus membrane perforate to microreticulate; margo distinct, psilate. Endoapertures – pori, elongate elliptic with obtuse polar ends, much smaller than the width of ectoaperture, (6.40)-8.08-(9.80) X (2.00)-4.88-(7.60) µm, margin distinct; costa endopori present.

Exine:	Semitectate; exine thickness (3.20)-3.58-(4.00) μm ; sexine thicker than nexine; columellae distinct, clearly seen on both surface view and optical section, columellae circular when seen on surface view; simplicolumellate.
Ornamentation:	Reticulate (LM), lumina irregular in size and shape, circular to oblong and polygonal; heterobrochate; muri psilate (SEM).
Included taxa:	<i>Caesalpinia crista</i> L. – ເກົ່າ (ຊຸມພຣ, ດຣາດ); ພອຮະແວ (ມລາຍ-ນරາຊີວາສ) (FABACEAE) (Plate 17 A-J)

4.2.12 *Calophyllum inophyllum* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.85)-0.98-(1.08)
Shape class:	Suboblate to prolate spheroidal
Size class:	Small to medium sized $P=(24.50)-26.68-(29.80) \mu\text{m}$, $E=(25.20)-27.38-(29.80) \mu\text{m}$
Polar area index:	(0.20)-0.25-(0.34)
Polar outline:	Triangular to circular-triangular
Equatorial outline:	Circular to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (18.40)-21.82-(25.00) X (2.00)-2.36-(4.00) μm , narrow, margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate; costa ectocolpi present, somewhat indistinct. Endoapertures – colpi, lalongate elliptic with acute equatorial ends, or lalongate oblong with obtuse or diffused equatorial ends, or endocingulum present, (2.40)-4.56-(6.80) X (9.80)-12.30-(15.50) μm , margin distinct.
Exine:	Semitectate; exine thickness (2.00)-2.48-(3.00) μm ; sexine thicker than nexine; columella invisible under LM.

Ornamentation:	Microreticulate (LM), lumina circular, polygonal, and oblong, irregular in size and shape, lumina border angulated; heterobrochate; muri smooth, narrower at the top and gradually broader below (SEM).
Included taxa:	<i>Calophyllum inophyllum</i> L. – กระทิง, กระทึ่ง, กากกระทึ่ง, กากกระทิ้ง (กลาง); ทิ้ง (กระปี); เนาวakan (น่าน); สารกีฬาเล (ประจวบคีรีขันธ์); สารกีฬาแนน (เชียงใหม่, เชียงราย) CALOPHYLLACEAE (Plate 18 A-J)

4.2.13 *Calycopteris floribunda* type

Pollen class:	3-colporate with 3-pseudocolpate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.90)-0.95-(1.02)
Shape class:	Oblate spheroidal to prolate spheroidal
Size class:	Small $P=(16.50)-17.83-(19.80) \mu\text{m}$, $E=(17.20)-18.85-(21.20) \mu\text{m}$
Polar area index:	(0.50)-0.68-(0.80)
Polar outline:	Hexangular, triangular-hexangular, or circular-hexangular; planaperturate
Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, very short, half length of polar axis, (7.80)-9.08-(10.40) X (0.70)-1.07-(1.60) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate. Endoapertures – pori, long elliptic or sometimes circular, (2.00)-2.81-(3.60) X (3.40)-3.97-(5.20) μm , margin distinct; costa endopori present or absent. Pseudoapertures – colpi, alternate with true apertures, as long as or slightly longer than ectoapertures.
Exine:	Tectate perforate; exine thickness (1.60)-1.90-(2.20) μm , exine relatively thin at pseudoaperture; sexine thinner than nexine; columella invisible under LM.

Ornamentation:	Psilate (LM). Perforate, puncta irregular in size and shape, puncta circular, elliptic or oblong, puncta smaller than 5 μm (SEM); pseudoaperture surface psilate (LM), fossulate-perforate (SEM).
Included taxa:	<i>Calycopteris floribunda</i> (Roxb.) Lam. ex Poir. – ติงตั่ง, ติงตั่งตัวผู้ (เห็นอ); กรุด (สุราษฎร์ธานี); ข้าวตอกแดง (กลาง); งวงซูม (ขอนแก่น, เลย); งวงสูม (ตะวันออกเฉียงเหนือ, ปราจีนบุรี); งวงสูมขาว, เมี่ยงชานวนไฟ, สังขยาขาว (พิษณุโลก, สุโขทัย); ดาวสูม (อุบลราชธานี); ดอกโกร (เลย); ตะกรุด (นครศรีธรรมราช); ตาโนะ (มลายู-ยะลา); เก้าวัดยันดา (ราชบุรี); ประโยชน์ (ตราด); มันเครื่อ (กลาง, นครราชสีมา); มันแดง (กระบี่, ใต้); หน่วยสุด (ชุมพร, นครศรีธรรมราช) (COMBRETACEAE) (Plate 19 A-K)

4.2.14 *Cerbera manghas* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.89)-0.94-(1.09)
Shape class:	Oblate spheroidal to prolate spheroidal
Size class:	Medium sized to large $P=(42.80)-66.01-(75.20) \mu\text{m}$, $E=(45.70)-70.54-(82.80) \mu\text{m}$
Polar area index:	(0.28)-0.40-(0.55)
Polar outline:	Triangular to circular-triangular; angulaperturate
Equatorial outline:	Circular or subcircular
Apertures:	Ectoapertures – colpi, shorter than polar axis, (32.60)-52.60-(63.00) X (3.20)-9.57-(21.00) μm , margin distinct, oblong or widen at equator and sudden tapering toward poles, polar ends obtuse; margo present, psilate; colpus membrane granulate. Endoapertures – pori, elongate elliptic or subcircular, (9.00)-17.47-(25.00) X (4.00)-13.47-(25.20), margin distinct.

Exine:	Tectate perforate; exine thickness (1.60)-2.18-(3.00) μm ; sexine as thick as or thicker than nexine; columella invisible under LM.
Ornamentation:	Perforate; granulate or granulate-perforate on mesocolpia (LM). Perforate, puncta circular or subcircular, puncta smaller than 0.5 μm , fossulate-perforate or verrucate-perforate on mesocolpia (SEM).
Included taxa:	<i>Cerbera manghas</i> L. – ตินเป็ดทราย (ปีตดาวนี); ตินเป็ดเล็ก (กลาง, สุรัษฐ์ชานี); เทียนหนู, เนียนหนู (สตูล); ปงปง (พังงา); ปากเป็ด (ตราด); มะตากอ (มลายู-นราธิวาส); รักษา (จันทรบุรี, เพชรบุรี) (APOCYNACEAE) (Plate 20 A-K)
	<i>Cerbera odollam</i> Gaertn. – ตินเป็ดทะเล, ตินเป็ดน้ำ, ตินเป็ด (กลาง), ตุ่ม (กาญจนบุรี); มะตะกอ (มลายู-นราธิวาส); สั่งดา (กระเบี่ย, ระนอง) (APOCYNACEAE) (Plate 21 A-K)

4.2.15 *Ceriops decandra* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.72)-1.05-(1.55)
Shape class:	Suboblate to prolate
Size class:	Very small to small $P=(9.50)-14.69-(21.20) \mu\text{m}$, $E=(7.80)-14.14-(18.80) \mu\text{m}$
Polar area index:	(0.12)-0.28-(0.57)
Polar outline:	Triangular with slightly concave sides to triangular-circular
Equatorial outline:	Elliptic to circular-elliptic, or oblong-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (6.40)-12.69-(21.00) X (0.40)-1.15-(5.00) μm , wide or narrow, somewhat slit-like, margin distinct, slightly widen at equator and tapering toward poles, polar ends acute or obtuse; colpus membrane psilate or granulate; costa ectocolpi present. Endoapertures –

colpi, lalongate elliptic to lalongate oblong, or endocingulum present, equatorial ends obtuse, acute, or diffused, polar sides parallel or constrict at the middle part, (1.20)-2.37-(7.80) X (4.20)-6.49-(10.20) μm , margin distinct; costa endocolpi or costa endocinguli present.

Exine: Tectate imperforate, tectate perforate, somewhat semitectate; exine thickness (0.60)-1.26-(2.40) μm ; sexine as thick as or thinner than nexine; columella invisible under LM.

Ornamentation: Psilate (LM). Microreticulate, sparsely to densely perforate, puncta smaller than 0.5 μm , or psilate with very small round depressions less than 0.5 μm (SEM).

Included taxa: *Aegiceras corniculatum* (L.) Blanco – เกี้บมี่อนาง (กลาง, นครราชสีมา); ลำพู (กลาง, ตรัง); เล็บนาง (สตูล); แสมแดง (ชุมพร, ใต้); แสมทะเล (กลาง, ปัตตานี) (PRIMULACEAE) (Plate 22 A-J)

Bruguiera cylindrica (L.) Blume – ถั่วขาว (กระปี่, ระนอง); ถั่วแดง (กทม., ลำปาง); บڑีส, โปรย (มาหยู-ใต้); ประสักขาว (จันทรบุรี); ปรุย (มาหยู-สตูล); โปรย (ใต้, มาหยู-ใต้); รุย (เพชรบุรี) (RHIZOPHORACEAE) (Plate 23 A-J)

Bruguiera gymnorhiza (L.) Savigny – พังกาหัวสูมดอกแดง, พังกาหัวสูม, ประสัก, ประสักแดง, โคงกงหัวสูม (กลาง); พลัก (RHIZOPHORACEAE) (Plate 24 A-J)

Bruguiera parviflora (Roxb.) Wight & Arn. ex Griff. – ถั่วคำ (กระปี่, กลาง); ถั่วทะเล (ระนอง); รังกะแท้ (จันทรบุรี, narachivat); ลังกระได, หนังกระได (มาหยู-ใต้) (RHIZOPHORACEAE) (Plate 25 A-J)

Bruguiera sexangula (Lour.) Poir. – พังกาหัวสูมดอกขาว, ประสักขาว, ประสักหนู; ขลัก (ชุมพร); นากาห์ (มาหยู-นราธิวาส); ประสักแดง

(จันทรบุรี, ตราด); พังก้าหัวสูม (กระนี่, ตรัง) (RHIZOPHORACEAE)
(Plate 26 A-J)

Ceriops decandra (Griff.) W. Theob. – โปรดงขาว (สมุทรสาคร);
โปรดง, โปรดงหนู, ปะโลง, โหลง (กลาง); กระปูโลง, โปลง, โปรดง
(เพชรบุรี); แสมมานาเนะ (สตูล); แหม (ใต้, ภูเก็ต)
(RHIZOPHORACEAE) (Plate 27 A-J)

Ceriops tagal (Perr.) C.B. Rob. – โปรดงแดง (สมุทรสาคร); โปรดง (กลาง
, สมุทรสาคร); แสม (กลาง, ใต้) (RHIZOPHORACEAE) (Plate 28 A-J)

Kandelia candel (L.) Druce – รังกะแท้ (จันทรบุรี, นราธิวาส); ลุย
(จันทรบุรี) (RHIZOPHORACEAE) (Plate 29 A-J)

Rhizophora apiculata Blume – โคงกางใบเล็ก (กลาง); โคงกาง
(นครราชสีมา, สารบุรี); พังก้าทราย (กระนี่); พังก้าใบเล็ก (พังงา)
(RHIZOPHORACEAE) (Plate 30 A-J)

Rhizophora mucronata Lam. – โคงกางใบใหญ่ (กลาง); กงกอน
(ชลบุรี, เพชรบุรี); กงกางนอก (เพชรบุรี); กงกง (นครปฐม); กงกง,
พังก้าใบใหญ่ (ใต้) (RHIZOPHORACEAE) (Plate 31 A-J)

Key to subtypes:

- 1a Ectoaperture relatively wide ((3.00)-3.92-(5.00) μm in width); endoaperture sometimes protruding beyond ectoaperture.....*Aegiceras corniculatum* subtype
- 1b Ectoaperture relatively narrow ((0.40)-0.84-(1.80) μm in width); endoaperture not protruding beyond ectoaperture.....2
- 2a Endocingulum present; grains subprolate to prolate; size class very small to small, P=(10.20)-11.50-(12.40) μm , E=(7.80)-8.35-(9.20) μm ; PAI=(0.33)-0.43-(0.57); equatorial outline elliptic to oblong-elliptic; ornamentation psilate with very small round depressions smaller than 0.5 μm (SEM)..*Bruguiera parviflora* subtype

- 2b Endocingulum present or absent; if endocingulum present, Grains prolate spheroidal to subprolate; size class small, $P=(17.20)-18.69-(21.00)$ μm , $E=(15.88)-16.65-(18.20)$ μm ; PAI=(0.19)-0.26-(0.38); equatorial outline elliptic to circular-elliptic; ornamentation microreticulate or perforate (SEM).....*Ceriops decandra* subtype
(Including: *B. cylindrica*; *B. gymnorhiza*; *B. sexangula*; *C. decandra*; *C. tagal*; *K. candel*; *R. apiculata*; *R. mucronata*)

Remarks:

Pollen grains in this type look similar when see under LM. However, they can be subdivided into two as demonstrated in the key to subtypes. In *Ceriops decandra* subtype, pollen grains of *R. apiculata* and *R. mucronata* generally have endocingula, but sometimes endoapertures are elliptic oblong with diffused equatorial ends. In case of endocingulum are not presented, there is gradience of variation in pollen morphology in this subtype. It is hard to distinguish these pollen grains, but it can be noticed that there are some differences in some grains of each species as follow:

- 1) Under SEM investigation, ornamentation of *R. apiculata* is densely perforate to microreticulate; *C. decandra*, *C. tagal*, *K. candel*, and *R. mucronata* are densely or sparsely perforate; *B. cylindrica*, *B. gymnorhiza*, and *B. sexangula* are psilate with very small round depressions.
- 2) Polar outline of *B. gymnorhiza*, *B. sexangula*, and *R. apiculata* is generally triangular with slightly covcave to slightly convex sides while of *B. cylindrica*, *C. tagal*, *K. candel*, and *R. mucronata* is generally triangular with convex sides, and of *C. decandra* is generally triangular-circular.
- 3) Equatorial outline of *C. decandra* and *C. tagal* are generally subcircular, of *K. candel*, *R. apiculata* and, *R. mucronata* are generally circular-elliptic ($P>E$), and of *B. cylindrica*, *B. gymnorhiza*, and *B. sexangula* are generally circular-elliptic ($P<E$).
- 4) Size of *B. cylindrical* and *C. tagal* is relatively smaller.

4.2.16 *Clerodendrum inerme* type

Pollen class:	3-colpate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.98)-1.04-(1.11)
Shape class:	Oblate spheroidal to prolate spheroidal
Size class:	Medium sized $P=(29.40)-35.71-(41.50) \mu\text{m}$, $E=(30.00)-34.42-(40.00) \mu\text{m}$
Polar area index:	(0.32)-0.43-(0.56)
Polar outline:	Circular-triangular
Equatorial outline:	Circular to circular-elliptic
Apertures:	Colpi, (17.50)-21.13-(27.00) X (2.00)-2.54-(3.50) μm , margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; colpus membrane microechinate to echinate.
Exine:	Tectate perforate; exine thickness (1.40)-1.78-(2.00) μm ; sexine as thick as or thicker than nexine; columellae distinct, clearly seen on both surface view and optical section.
Ornamentation:	Granulate (LM). Microechinate to finely echinate, echinae conical with point end; area between echinae perforate, puncta circular, smaller than 0.5 μm , tectum surface psilate (SEM).
Included taxa:	<i>Clerodendrum inerme</i> (L.) Gaertn. – สำมางา, สำมะลึง, สำลึง (กลาง, ตะวันออก); เที่ยว (กลาง, สุร้ายู้ร์ชานี); คาด (ใต้); สำมเนรา (ยะอง); ตักหรี่ย่าน (ชุมพร); สำปันงา (สตูล) (LAMIACEAE) (Plate 32 A-J)

4.2.17 *Crinum asiaticum* type

Pollen class:	2-colpate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.88)-0.99-(1.15)
Shape class:	Suboblate to subprolate

Size class:	Medium sized to large $P=(32.40)-40.35-(51.80) \mu\text{m}$, $E=(35.80)-40.69-(46.70) \mu\text{m}$
Polar area index:	(0.22)-0.29-(0.33)
Polar outline:	Circular to circular-elliptic
Equatorial outline:	Circular to circular-elliptic
Apertures:	Colpi, (6.00)-10.22-(21.80) X (27.80)-39.44-(45.20) μm , margin distinct, widen at equator and gradually tapering toward poles, ends obtuse; colpus membrane granulate.
Exine:	Tectate imperforate; exine thickness (1.80)-2.19-(2.80) μm ; sexine thicker than nexine; columella invisible under LM.
Ornamentation:	Granulate (LM). Microechinate to small echinate, area between echinae microbaculate (SEM).
Included taxa:	<i>Crinum asiaticum</i> L. – พลับพลึง (กลาง); ติ่ว (เหนือ) (AMARYLIDACEAE) (Plate 33 A-J)

4.2.18 *Cynometra ramiflora* type

Pollen class:	3-(syn)colporate
Dispersal unit:	Monad
Polarity:	Isopolar or heteropolar
P/E ratio:	(0.94)-0.99-(1.06)
Shape class:	Oblate spheroidal to prolate spheroidal
Size class:	Small to medium sized $P=(23.60)-24.51-(27.40) \mu\text{m}$, $E=(22.60)-24.85-(28.80) \mu\text{m}$
Polar area index:	(0.12)-0.16-(0.21)
Polar outline:	Circular to circular-triangular
Equatorial outline:	Circular to subcircular
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (19.00)-21.62-(26.00) X (2.60)-3.66-(4.80) μm , margin distinct, widen at equator and sudden tapering toward poles, polar ends acute or obtuse, somewhat fused at poles; costa ectocolpi present; colpus membrane granulate. Endoapertures – pori, large, circular

or subcircular, (4.00)-5.03-(7.20) X (4.00)-5.33-(7.20), margin distinct, slightly protruding, protruding beyond ectoaperture when open, some grains endoapertures situated near apocolpium.

Exine:	Tectate perforate; exine thickness (1.20)-1.70-(2.00) μm ; sexine as thick as nexine; columella invisible under LM.
Ornamentation:	Psilate (LM). Densely perforate, puncta smaller than 0.5 μm (SEM).
Included taxa:	<i>Cynometra ramiflora</i> L. – ມະ (ກລາງ, ປຶ້ຕານີ); ມັກຂະ, ພັກຂະ (ກລາງ, ໄດ້); ພັກຄ່າ (ຕວັງ, ນາຮິວາສ); ມະຄາກ (ໄຕ້); ແມ່ງຂະ (ຕຣາດ) (FABACEAE) (Plate 34 A-J)

4.2.19 *Dalbergia candenatensis* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.91)-1.03-(1.16)
Shape class:	Oblate spheroidal to subprolate
Size class:	Small $P=(16.60)-19.71-(23.20) \mu\text{m}$, $E=(17.60)-19.19-(22.40) \mu\text{m}$
Polar area index:	(0.26)-0.41-(0.50)
Polar outline:	Circular to circular-triangular
Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, two thirds of polar axis, (11.00)-12.24-(14.00) X (1.80)-2.80-(5.40) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate; costa ectocolpi usually present, sometimes indistinct. Endoapertures – colpi, very large, lalongate oblong-elliptic, equatorial ends obtuse, (2.20)-3.73-(5.70) X (7.00)-8.13-(10.00), margin distinct, distinctly protruding beyond ectoaperture even

	endoaperture still closed; costa endopori present, some grains costae indistinct.
Exine:	Tectate perforate; exine thickness (1.00)-1.37-(1.80) μm ; sexine thinner than nexine; columella invisible under LM.
Ornamentation:	Psilate (LM). Sparsely perforate, puncta smaller than 0.5 μm (SEM).
Included taxa:	<i>Dalbergia candenatensis</i> (Dennst.) Prain – สักปี (กลาง, นราธิวาส); เกามันเปรียง (นราธิวาส, สุราษฎร์ธานี); เถาวลักษ์เปรียง (กลาง, สุราษฎร์ธานี); ย่านมันเปรียง (นราธิวาส) (FABACEAE) (Plate 35 A-J)

4.2.20 *Derris trifoliata* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.71)-0.89-(1.13)
Shape class:	Oblate to prolate spheroidal
Size class:	Small to medium sized $P=(15.80)-19.85-(24.20) \mu\text{m}$, $E=(19.00)-22.49-(29.00) \mu\text{m}$
Polar area index:	(0.24)-0.39-(0.60)
Polar outline:	Triangular with convex sides to circuar-triangular; angulaperturate
Equatorial outline:	Circular to circular-elliptic
Apertures:	Ectoapertures – colpi, (11.00)-15.37-(20.00) X (1.60)-2.94-(4.00) μm , wide, margin distinct, slightly widen at equator and tapering toward poles, polar ends acute or obtuse; colpus membrane granulate; costa ectocolpi present. Endoapertures – colpi, lalongate elliptic or lalongate oblong, equatorial ends obtuse, (2.80)-5.00-(8.20) X (6.40)-8.05-(10.50), margin distinct.
Exine:	Tectate perforate; exine thickness (0.80)-1.47-(2.00) μm ; sexine as thick as, thiner or thicker than nexine; columella invisible under LM.

- Ornamentation: Microreticulate (LM). Perforate (SEM).
- Included taxa: *Derris trifoliata* Lour. – ດອບແຄນໜ້າ, ແກວບທະເລ, ພັກແຄນ (ກລາງ);
 ດອບແຄນທະເລ (ເພິ່ນບູນ); ຄ້ວນໜ້າ (ນරາຊີວາສ); ທັນແຄນ (ສຸມຫຼຮສົງຄຣາມ)
 (FABACEAE) (Plate 36 A-J)
- Pongamia pinnata* (L.) Merr. – ແມ່ນໜ້າ; ກາຍີ, ລາໂຢັດ (ໄຕ້); ປາກີ (ມລາຍ-
 ສັງຄາ) (FABACEAE) (Plate 37 A-J)

Key to subtypes:

- 1a Ectoaperture polar ends obtuse; endoapertures lalongate elliptic or lalongate oblong; ornamentation perforate with globule-like granules inside puncta, puncta irregular in size and shape, circular, polygonal and oblong (SEM).....*Derris trifoliata* subtype
- 1b Ectoaperture polar ends acute; endoapertures lalongate elliptic; ornamentation perforate, puncta irregular in size and shape, circular, polygonal and oblong, puncta smaller than 0.5 µm (SEM).....*Pongamia pinnata* subtype

4.2.21 *Diospyros areolata* type

- Pollen class: 3-colporate
- Dispersal unit: Monad
- Polarity: Isopolar or heteropolar
- P/E ratio: (0.94)-1.04-(1.15)
- Shape class: Oblate spheroidal to subprolate
- Size class: Medium sized
 $P=(33.20)-36.81-(39.20) \mu\text{m}$, $E=(32.40)-35.30-(38.20) \mu\text{m}$
- Polar area index: (0.15)-0.20-(0.26)
- Polar outline: Triangular to circular-triangular
- Equatorial outline: Circular to circular-elliptic
- Apertures: Ectoapertures – colpi, as long as polar axis or slightly shorter, (29.40)-32.15-(35.00) X (2.20)-2.60-(3.40) µm, margin distinct, widen at equator and tapering toward poles, polar ends acute or

	obtuse; colpus membrane granulate; costa ectocolpi present. Endoapertures – colpi, lalongate elliptic, (3.80)-4.83-(7.00) X (11.20)-13.14-(15.40) μm , margin distinct, some grains endoapertures slightly situated above or below equatorial plane; costa endocolpi present.
Exine:	Tectate imperforate; exine thickness (1.40)-1.76-(2.00) μm ; sexine as thick as or thicker than nexine; columella invisible under LM.
Ornamentation:	Psilate (LM). Microstriato-rugulate (SEM).
Included taxa:	<i>Diospyros areolata</i> King & Gamble – มะพลับ, พลับ (กลาง) (EBENACEAE) (Plate 38 A-J)

4.2.22 *Dolichandrone spathacea* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.93)-1.02-(1.16)
Shape class:	Oblate spheroidal to subprolate
Size class:	Medium sized $P=(32.20)-39.15-(47.50) \mu\text{m}$, $E=(30.80)-38.43-(46.40) \mu\text{m}$
Polar area index:	(0.16)-0.22-(0.27)
Polar outline:	Circular-triangular
Equatorial outline:	Circular to circular-elliptic
Apertures:	Colpi, slightly shorter than polar axis, (24.20)-31.80-(40.50) X (6.00)-7.68-(9.40) μm , wide, margin distinct, widen at equator and gradually tapering toward poles, polar ends acute; colpus membrane psilate; costa colpi present.
Exine:	Semitectate; exine thickness (1.20)-1.75-(2.20) μm ; sexine as thick as nexine; columellae distinct, clearly seen on both surface view and optical section; simplicolumellate.

Ornamentation:	Reticulate, lumina irregular in size and shape, lumina circular and polygonal; heterobrochate (LM); muri psilate (SEM).
Included taxa:	<i>Dolichandrone spathacea</i> (L. f.) Seem. – ແຄທະເລ (ຕරາດ); ແຄນ້ຳ (ກລາງ) (BIGNONIACEAE) (Plate 39 A-J)

4.2.23 *Drynaria quercifolia* type

Spore class:	Monolete
Dispersal unit:	Monad
Polarity:	Heteropolar
P/E ratio:	(0.50)-0.62-(0.68)
Shape class:	Oblate
Size class:	Medium sized to large $P=(27.00)-31.25-(33.80) \mu\text{m}$, $E=(44.40)-50.74-(55.20) \mu\text{m}$
Arm length/radius:	-
Shape:	Ellipsoidal or boat-shape
Laesura:	Monolete, distinct, protruding, (0.80)-1.42-(2.20) X (11.00)-17.59-(25.00) μm .
Sclerine:	Sclerine thickness (0.80)-1.16-(1.50) μm ; perine thiner than exospore.
Ornamentation:	Echinate, echinae slender conical with point end, (0.50)-0.68-(1.00) X (2.20)-3.24-(3.70) μm (LM); area between echinae granulate to finely verrucate (SEM).
Included taxa:	<i>Drynaria quercifolia</i> (L.) J. Sm. – ກະແຕໄຕ່ໄນ້ (ກລາງ); ກະປ່ອກວ່າວ (ຊັບນຸ້ມ, ປະຈິນນຸ້ມ); ຄູດຫາສອກ, ເຊົວນະ, ພຸດອອງແຄະ (ກະເຮືຍ, ແມ່ຂ່ອງສອນ); ເຄົນກາໂລະ (ມລາຢູ່-ປັດຕານີ); ໃບໜູ້ໜ້າ, ສະໄບນາງ (ກາມູຈນນຸ້ມ); ສະໄມ່ (ນຣາຊີວາສ, ສ່ວຍ-ສູຣິນທີ); ຫ້ວວ່າວ (ໄຕ້, ປະຈວບຄື່ອນໜັ້ນ) (POLYPODIACEAE) (Plate 40 A-H)

4.2.24 *Excoecaria agallocha* type

Pollen class:	3-colporate
Dispersal unit:	Monad

Polarity:	Isopolar
P/E ratio:	(0.80)-0.89-(1.02)
Shape class:	Suboblate to prolate spheroidal
Size class:	Small to medium sized $P=(24.20)-27.45-(30.00) \mu\text{m}$, $E=(23.80)-31.14-(38.80) \mu\text{m}$
Polar area index:	(0.18)-0.21-(0.26)
Polar outline:	Triangular with straight sides to circular-triangular; planaperturate
Equatorial outline:	Circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (21.40)-23.86-(28.50) X (0.60)-2.06-(3.20) μm , very narrow or slit-like, margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; costa ectocolpi present; margo present, psilate; colpus membrane granulate. Endoapertures – pori, lalongate oblong or lalongate elliptic, equatorial ends diffused, some grains endoaperture indistinct, (3.20)-4.57-(6.20) X (5.40)-7.83-(11.40) μm .
Exine:	Semitectate; exine thickness (2.20)-0.65-(3.00) μm ; sexine as thick as nexine; columellae distinct, clearly seen on both surface view and optical section, columellae circular when seen on surface view.
Ornamentation:	Microreticulate (LM). Microreticulate to finely reticulate, lumina circular or elliptic, different in size; muri with minute granules, especially around lumina, narrower at the top and sudden broader below (SEM).
Included taxa:	<i>Excoecaria agallocha</i> L. – ຕາຕຸ້ນ, ຕາຕຸ້ນທະເລ (ກລາງ); ນູດອ (ມລາຍ-ປັດຕານີ) (EUPHORBIACEAE) (Plate 41 A-J)

4.2.25 *Ficus microcarpa* type

Pollen class:	2-porate
Dispersal unit:	Monad
Polarity:	Subisopolar

P/E ratio:	(0.70)-0.78-(0.88)
Shape class:	Oblate to oblate spheroidal
Size class:	Very small to small $P=(7.00)-8.09-(9.00) \mu\text{m}$, $E=(9.30)-10.46-(12.50) \mu\text{m}$
Polar area index:	-
Polar outline:	Elliptic
Equatorial outline:	Elliptic with one slightly convex side and one distinctly convex side
Apertures:	Pori subcircular to long elliptic, $(1.20)-1.41-(1.80) \times (0.70)-1.05-(1.20) \mu\text{m}$.
Exine:	Exine thickness $(0.70)-0.85-(1.00) \mu\text{m}$; exine stratification obscure.
Ornamentation:	Psilate (LM). Psilate with uneven surface (SEM).
Included taxa:	<i>Ficus microcarpa</i> L. f. – ไทรป้อมใบทุ่ง (นครศรีธรรมราช); ไทรป้อม (สุราษฎร์ธานี); ไทรหิน (ชุมพร); ไทร (เพชรบูรณ์) (MORACEAE) (Plate 42 A-G)

4.2.26 *Flagellaria indica* type

Pollen class:	1-porate
Dispersal unit:	Monad
Polarity:	Heteropolar
P/E ratio:	$(0.81)-0.90-(0.99)$
Shape class:	Suboblate to oblate spheroidal
Size class:	Small $P=(15.00)-16.49-(18.50) \mu\text{m}$, $E=(16.40)-18.44-(21.80) \mu\text{m}$
Polar area index:	-
Polar outline:	Circular or subcircular
Equatorial outline:	Circular to circular-elliptic
Apertures:	Pori, circular to subcircular, $(2.20)-2.73-(3.20) \times (2.20)-2.54-(3.00) \mu\text{m}$, pore membrane granulate; annulus present.

Exine:	Tectate perforate; exine thickness (1.20)-1.59-(1.80) μm ; sexine thicker than nexine; columella invisible under LM.
Ornamentation:	Perforate (LM). Uneven with irregular sexine elements in various polygonal shape and irregular perforate (SEM).
Included taxa:	<i>Flagellaria indica</i> L. – หวานดึง (ใต้, นราธิวาส); หวานเย็บจาก, หวานดึง (ใต้) (FLAGELLARIACEAE) (Plate 43 A-G)

4.2.27 *Glochidion littorale* type

Pollen class:	4-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.88)-0.94-(1.01)
Shape class:	Suboblate to prolate spheroidal
Size class:	Small to medium sized $P=(19.50)-22.02-(24.40) \mu\text{m}$, $E=(20.40)-12.45-(25.60) \mu\text{m}$
Polar area index:	(0.33)-0.38-(0.45)
Polar outline:	Circular to circular-tetragonal
Equatorial outline:	Circular to subcircular
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (12.60)-14.56-(17.20) X (0.60)-1.79-(2.80) μm , margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; margo present, psilate; colpus membrane granulate. Endoapertures – pori, circular or subcircular, (1.80)-2.41-(3.00) X (2.00)-2.54-(3.00) μm , margin distinct; costa endopori present.
Exine:	Semitectate; exine thickness (2.20)-2.58-(2.80) μm ; sexine thicker than nexine; columellae simplicolumellate, distinct, clearly seen on both surface view and optical section.
Ornamentation:	Microreticulate to finely reticulate, lumina circular, elliptic, or somewhat polygonal, irregular in size and shape; heterobrochate; muri psilate (SEM).

Included taxa: *Glochidion littorale* Blume – มันปุ่ (ตรัง, สงขลา); นกนองทะเด
(นราธิวาส) (PHYLLANTHACEAE) (Plate 44 A-J)

4.2.28 *Heritiera littoralis* type

Pollen class: 3-colporate

Dispersal unit: Monad

Polarity: Isopolar or heteropolar

P/E ratio: (0.92)-0.96-(1.01)

Shape class: Oblate spheroidal to prolate spheroidal

Size class: Small
 $P=(15.20)-17.46-(19.00) \mu\text{m}$, $E=(15.50)-18.28-(20.60) \mu\text{m}$

Polar area index: (0.20)-0.28-(0.34)

Polar outline: Circular to circular-triangular

Equatorial outline: Circular to subcircular

Apertures: Ectoapertures – colpi, as long as polar axis or slightly shorter, (11.80)-13.66-(14.80) X (0.60)-0.92-(1.40) μm , margin distinct, slightly widen at equator and tapering toward poles, polar ends acute or obtuse; colpus membrane granulate; costa ectocolpi present. Endoapertures – colpi, lalongate elliptic, (1.40)-1.73-(2.00) X (2.80)-3.84-(5.00) μm , margin distinct, some grains endoapertures slightly situated above or below equatorial plane.

Exine: Tectate perforate; exine thickness (0.60)-0.94-(1.20) μm ; sexine as thick as or thinner than nexine; columellae obscure.

Ornamentation: Granulate (LM). Granulate-rugulate(SEM).

Included taxa: *Heritiera littoralis* Aiton (W. & A.) Clos – หงอนไก่ทะเด (กลาง, สุรินทร์); ไข่ควาย (กระนี่, ชุมพร); ดุหุน (ตรัง); หงอนไก่ (กลาง, อุบลราชธานี) (MALVACEAE) (Plate 45 A-J)

4.2.29 *Horsfieldia irya* type

Pollen class: 1-colporate

Dispersal unit: Monad

Polarity:	Heteropolar
P/E ratio:	(0.75)-0.83-(0.92)
Shape class:	Oblate to oblate spheroidal
Size class:	Small $P=(12.80)-14.03-(15.20) \mu\text{m}$, $E=(14.80)-16.90-(19.00) \mu\text{m}$
Polar area index:	-
Polar outline:	Oblong-elliptic
Equatorial outline:	Triangular with flat-top on longer equatorial side, and slightly quadrangular on shorter equatorial side
Apertures:	Colpi, (11.40)-12.85-(14.80) X (1.20)-1.68-(2.20) μm , margin distinct, outline oblong, ends obtuse.
Exine:	Semitectate; exine thickness (0.80)-1.10-(1.40) μm ; sexine thicker than nexine; infratectum columellate, columellae clearly seen on optical section.
Ornamentation:	Microreticulate, lumina polygonal, irregular in size and shape; heterobrochate (LM); muri psilate (SEM).
Included taxa:	<i>Horsfieldia irya</i> (Gaertn.) Warb. – กรวย, กรวยน้ำ, กรวยสวน (กทม.); กะเพราจะพระ, เพราจะพระ (ชุมพร); จุ่มพร้า (นครศรีธรรมราช); ดีอระแซ (มาเลฯ-ปีตานี); ตุมพระ (นครศรีธรรมราช, สตูล); ยาุง (สตูล); ระหัน (ปีตานี); หัน (ใต้, ปีตานี) (MYRISTICACEAE) (Plate 46 A-J)

4.2.30 *Intsia bijuga* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.90)-1.04-(1.19)
Shape class:	Oblate spheroidal to subprolate
Size class:	Medium sized to large $P=(48.80)-56.70-(72.40) \mu\text{m}$, $E=(45.50)-54.75-(62.20) \mu\text{m}$
Polar area index:	(0.48)-0.55-(0.63)
Polar outline:	Circular to circular-triangular

Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, short, (18.00)-25.72-(33.20) X (4.20)-7.68-(11.00) μm , margin distinct, shape irregular or polygonal-oblong, polar ends obtuse or acute; colpus membrane granulate. Endoapertures – pori, shape irregular or polygonal, (8.80)-10.26-(11.50) X (6.00)-8.70-(12.00) μm , margin (in)distinct.
Exine:	Semitectate; exine thickness (8.00)-9.29-(10.40) μm ; sexine thicker than nexine; columellae simplicolumellate, distinct, large, clearly seen on both surface view and optical section; on surface view columellae irregular in size and shape, circular, polygonal, or oblong.
Ornamentation:	Reticulate (LM). Reticulate, lumina polygonal, irregular in size and shape, heterobrochate; muri psilate; lumina with free-standing columellae, sharp or blunt end (SEM).
Included taxa:	<i>Intsia bijuga</i> (Colebr.) Kuntze – หลุมพอทะเล (สุร้ายภูรัชานี); จืោបា តាវីខែ (មគ្មុ-នរាជិវាស); ប្រជុំភេល (កតាង) (FABACEAE) (Plate 47 A-J)

4.2.31 *Lecanopteris sinuosa* type

Spore class:	Monolete
Dispersal unit:	Monad
Polarity:	Heteropolar
P/E ratio:	(0.60)-0.66-(0.79)
Shape class:	Oblate to suboblate
Size class:	Small to medium sized $P=(24.20)-29.35-(34.80) \mu\text{m}$, $E=(37.80)-44.57-(48.80) \mu\text{m}$
Arm length/radius:	-
Shape:	Ellipsoidal or boat-shape
Laesura:	Monolete, distinct, protruding, (0.80)-1.08-(1.60) X (15.50)-18.19-(21.00) μm .

Sclerine:	Sclerine thickness (0.80)-1.12-(1.40) μm ; perine thiner than exospore.
Ornamentation:	Granulate or psilate (LM). Psilate with small globules or mass of particles on surface (SEM).
Included taxa:	<i>Lecanopteris sinuosa</i> (Wall. ex Hook.) Copel. – ຕາລມັກຮຣ (ກທມ., ຕະວັນຕົກເສື່ອງໄຕ້) (POLYPODIACEAE) (Plate 48 A-H)

4.2.32 *Lumnitzera littorea* type

Pollen class:	3-colporate with 3-pseudocolpate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.60)-0.94-(1.11)
Shape class:	Oblate to prolate spheroidal
Size class:	Small to medium sized $P=(15.20)-24.00-(31.60) \mu\text{m}$, $E=(15.20)-25.62-(32.50) \mu\text{m}$
Polar area index:	(0.14)-0.25-(0.36)
Polar outline:	Triangular-hexangular or hexangular, concave on the middle part of each side
Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (15.00)-20.71-(27.00) X (2.40)-3.53-(4.60) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate. Endoapertures – colpi, lalongate elliptic or rarely lalongate oblong and circular, (2.40)-5.40-(7.80) X (4.60)-7.25-(11.50) μm , margin distinct. Pseudoapertures – colpi, alternate with true apertures.
Exine:	Tectate perforate; exine thickness (1.80)-2.14-(2.80) μm ; sexine as thick as or thinner than nexine; columella invisible under LM.
Ornamentation:	Perforate (LM and SEM); pseudoaperture surface psilate (LM), flattened granulate or densely granulate (SEM).

Included taxa: *Lumnitzera littorea* (Jack) Voigt – ฝ่าดเดง (กลาง, ใจ); ต้าสาทะเด (กระนี่, พังงา) (COMBRETACEAE) (Plate 49 A-K)

Lumnitzera racemosa Willd. – ฝ่าดขาว (กลาง); กะลุง (ชุมพร); ขวด (เชียงราย, สุโขทัย); ฝ่าด (กลาง, พังงา); ลำแพน (กลาง, สตูล); ลำแพนหิน (จันทรบุรี, ตราด) (COMBRETACEAE) (Plate 50 A-K)

Remarks:

Noticeably, under SEM, the detail of ornamentation between these two species is quite different. Perforations of *L. littorea* seem to be smaller than 0.5 μm while those of *L. racemosa* are generally bigger than 0.5 μm and irregular in size and shape - circular, oblong or polygoanal. Moreover, pollen grains of *L. littorea* have densely granulation on pseudocolpi, and have triangular-hexangular or hexangular polar outline. Pollen grains of *L. racemosa* have pseudocolpi with psilate or flattened granulate, and have hexangular or rarely triangular-hexangular polar outline.

4.2.33 *Melaleuca cajuputi* type

Pollen class:	3-parasyncolporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.39)-0.54-(0.73)
Shape class:	Peroblate to oblate
Size class:	Very small to small $P=(7.20)-8.35-(10.20) \mu\text{m}$, $E=(13.00)-15.92-(19.00) \mu\text{m}$
Polar area index:	(0.29)-0.40-(0.50)
Polar outline:	Triangular with straight to concave sides; angulaperturate
Equatorial outline:	Elliptic to elliptic-oblong
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (5.00)-6.28-(7.00) X (0.20)-0.40-(0.60) μm , narrow or slit-like, margin distinct, slightly widen at equator and tapering toward poles and anastomosing forming synaperturate with triangular apocolpial

field; colpus membrane granulate. Endoapertures – colpi, lalongate oblong with obtuse equatorial ends, (0.60)-0.77-(1.00) X (3.00)-3.73-(4.60), margin distinct; costa endocolpii present, somewhat indistinct.

Exine:	Tectate imperforate; exine thickness (0.60)-0.84-(1.20) μm ; sexine thiner than nexine.
Ornamentation:	Psilate (LM). Fossulate-granulate (SEM).
Included taxa:	<i>Melaleuca cajuputi</i> Powell – ເສມື້ດ (ກລາງ); ເມື້ດ, ແໜື້ດ (ໄຕ້) (MYRTACEAE) (Plate 51 A-J)

4.2.34 *Melastoma saigonense* type

Pollen class:	3-colporate with 3-pseudocolpate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.89)-1.06-(1.20)
Shape class:	Oblate spheroidal to subprolate
Size class:	Small $P=(16.00)-19.68-(24.80) \mu\text{m}$, $E=(21.50)-18.50-(15.70) \mu\text{m}$
Polar area index:	(0.11)-0.14-(0.23)
Polar outline:	Circular to circular-hexangular; planaperturate
Equatorial outline:	Circular to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (13.50)-15.68-(20.00) X (2.20)-2.63-(4.20) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute; colpus membrane finely granulate. Endoapertures – colpi, lalongate oblong-elliptic with acute equatorial ends, sometimes equatorial ends diffused, (2.00)-3.99-(6.20) X (5.80)-8.57-(11.00) μm , margin distinct. Pseudoapertures – broad colpi with obtuse polar ends, alternate with true apertures, as long as ectoaperture.

Exine:	Tectate to slightly tectate perforate; exine thickness (0.80)-1.00-(1.20) μm ; sexine as thick as nexine; columella invisible under LM.
Ornamentation:	Psilate (LM). Psilate with very small round depressions less than 0.5 μm , or with sparsely minute puncta (SEM); pseudoaperture surface psilate (LM), finely granulate (SEM).
Included taxa:	<i>Melastoma saigonense</i> (Kuntze) Merr. – ໂຄລົງເຄລົງຂວານ (ຕະວັນອອກ); ໂຄລົງເຄລົງຂນ (ປຣາຈິນບູຮີ); ມ່າຍະ (ຊອງ-ຕຣາດ); ເອັນອ້າ (ປຣາຈິນບູຮີ, ອຸນລາຮາຫານີ) (MELASTOMATACEAE) (Plate 52 A-K)

4.2.35 *Nypa fruticans* type

Pollen class:	1-zona-aperturate
Dispersal unit:	Monad
Polarity:	Isoopolar
P/E ratio:	(1.00)-1.06-(1.14)
Shape class:	Oblate spheroidal to subprolate
Size class:	Medium sized $P=(32.20)-39.71-(48.00) \mu\text{m}$, $E=(31.00)-37.29-(42.50) \mu\text{m}$
Polar area index:	-
Polar outline:	Circular to subcircular
Equatorial outline:	Circular to subcircular
Apertures:	Colpi, (1.20)-1.45-(1.80) μm in width, ring-like, margin distinct; sulcus membrane psilate.
Exine:	Semiectate; exine thickness (1.50)-2.02-(2.40) μm ; sexine (excluded spines) thinner than nexine; columellae distinct, clearly seen on both surface view and optical section.
Ornamentation:	Echinate, echinae conical with point end, (1.80)-2.63-(3.40) X (2.80)-3.93-(5.40) μm , area between echinae perforate, finely foveolate, microreticulate, or reticulate, puncta or lumina irregular in size and shape, occasionally circular or elliptic, (LM). Echinate, area between echinae micoreticulate to finely reticulate (SEM).

Included taxa: *Nypa fruticans* Wurmb – จาก (กลาง); อัตตัง (มลายู-ไช้) (ARECACEAE) (Plate 53 A-F)

4.2.36 *Pandanus odoratissimus* type

Pollen class: 1-porate

Dispersal unit: Monad

Polarity: Heteropolar

P/E ratio: (1.15)-1.27-(1.39)

Shape class: Subprolate to prolate

Size class: Small
 $P=(16.80)-17.86-(20.20) \mu\text{m}$, $E=(13.00)-14.15-(15.20) \mu\text{m}$

Polar area index: -

Polar outline: Circular or subcircular

Equatorial outline: Elliptic

Apertures: Pori, subcircular to elliptic, (2.10)-2.84-(3.60) X (1.20)-1.89-(3.20) μm , situated at or near one of the longer axis, not always clearly visible.

Exine: Tectate imperforate; exine thickness (0.80)-1.07-(1.50) μm ; sexine as thick as or thicker than nexine; columella invisible under LM.

Ornamentation: Granulate (LM). Microechinate to echinate, echinae conical with point end, area between echinae densely granulate (SEM).

Included taxa: *Pandanus odoratissimus* L. f. – ลำเจี๊ยบ, เทพทะเด (กลาง); ปะหนัน, ปาแนง (มลายู-นราธิวาส) (PANDANACEAE) (Plate 54 A-H)

4.2.37 *Peltophorum pterocarpum* type

Pollen class: 3-colporate

Dispersal unit: Monad

Polarity: Isopolar

P/E ratio: (0.90)-0.95-(1.00)

Shape class: Oblate spheroidal to prolate spheroidal

Size class:	Medium sized
	P=(30.80)-39.34-(42.40) μm , E=(32.20)-41.59-(45.50) μm
Polar area index:	(0.41)-0.49-(0.53)
Polar outline:	Circular to circular-triangular
Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly longer than half of polar axis, (19.40)-23.87-(27.40) X (5.00)-5.86-(7.80) μm , margin distinct, widen at equator and tapering toward poles, polar ends obtuse or acute; colpus membrane granulate. Endoapertures – pori, lalongate elliptic or subcircular, (4.50)-6.20-(8.80) X (5.20)-7.23-(9.40) μm , margin distinct, protruding beyond ectoaperture; costa endopori present.
Exine:	Semitectate; exine thickness (3.50)-4.35-(5.20) μm ; sexine thicker than nexine, sexine usually detached from nexine; columellae simplicolumellate, distinct, clearly seen on both surface view and optical section; on surface view columellae irregular in size and shape, circular or polygonal.
Ornamentation:	Reticulate (LM). Reticulate, lumina polygonal, irregular in size and shape, heterobrochate; muri psilate; lumina with small granules (SEM).
Included taxa:	<i>Peltophorum pterocarpum</i> (DC.) Backer ex K. Heyne – นันทรี (กลาง); กระดินแดง (ตราด); กระดินป่า (ตราด, สุโขทัย); สารเงิน (เชียงใหม่, เชียงราย) (FABACEAE) (Plate 55 A-M)

4.2.38 *Pemphis acidula* type

Pollen class:	(3-)4-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(1.08)-1.16-(1.39)
Shape class:	Prolate spheroidal to prolate
Size class:	Small to medium sized

	P=(27.00)-29.59-(35.50) μm , E=(23.00)-25.44-(28.20) μm
Polar area index:	(0.31)-0.41-(0.50)
Polar outline:	Circular to circular-tetrangular or some grains triangular; planaperturate
Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, half length of polar axis, (13.00)-15.69-(18.00) X (2.00)-2.56-(3.20) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute or obtuse; colpus membrane granulate. Endoapertures – pori, circular or subcircular, (3.20)-5.41-(7.20) X (3.60)-5.58-(7.80), margin distinct, protruding beyond ectoaperture when open.
Exine:	Tectate imperforate; exine thickness (1.20)-1.83-(2.00) μm ; sexine thicker than nexine; colemellae distinct, clearly seen on both surface view and optical section, distinct when seen on apocolpium surface.
Ornamentation:	Psilate (LM and SEM).
Included taxa:	<i>Pemphis acidula</i> J.R. & G. Forst. – เพียงเล (สุร้ายภรรชานี) (LYTHRACEAE) (Plate 56 A-L)

4.2.39 *Phoenix paludosa* type

Pollen class:	1-colporate
Dispersal unit:	Monad
Polarity:	Heteropolar
P/E ratio:	(0.81)-0.88-(1.03)
Shape class:	Suboblate to prolate spheroidal
Size class:	Small
	P=(12.60)-13.97-(16.00) μm , E=(14.60)-15.82-(17.80) μm
Polar area index:	-
Polar outline:	Elliptic
Equatorial outline:	Circular-elliptic to elliptic on longer equatorial view, and circular-elliptic on shorter equatorial view

Apertures:	Colpi, aslong as or slightly shorter than longest equatorial axis (13.50)-14.03-(15.00) X (2.50)-3.04-(3.80) μm , margin distinct, irregular, outline oblong, ends obtuse; colpus membrane granulate; margo present, psilate.
Exine:	Semitectate; exine thickness (1.00)-1.36-(1.60) μm ; sexine thicker than nexine; columellae distinct, more clearly seen on optical section than on surface view.
Ornamentation:	Perforate or microreticulate (LM). Microreticulate or finely reticulate, lumina circular or polygonal and different in size; heterobrochate; muri psilate (SEM).
Included taxa:	<i>Phoenix paludosa</i> Roxb. – ເຸງທະເດ (ກລາງ) (ARECACEAE) (Plate 57 A-J)

4.2.40 *Planchonella obovata* type

Pollen class:	3(-4)-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(1.47)-1.53-(1.74)
Shape class:	Prolate
Size class:	Small to medium sized $P=(21.80)-24.35-(28.50) \mu\text{m}$, $E=(14.60)-15.86-(17.00) \mu\text{m}$
Polar area index:	(0.45)-0.52-(0.58)
Polar outline:	Circular to triangular-circular, or tetragonal-circular
Equatorial outline:	Oblong-elliptic with round polar ends
Apertures:	Ectoapertures – colpi, (15.20)-17.46-(22.00) X (0.60)-0.90-(1.20) μm , narrow, margin distinct, slightly protruding over endoapertures, polar ends obtuse; colpus membrane granulate. Endoapertures – colpi, long elliptic, (1.40)-2.23-(3.50) X (3.20)-4.25-(5.20), margin distinct; costa endocolpi present.

Exine:	Tectate to slightly tectate perforate; exine thickness (0.80)-1.23-(1.40) μm ; sexine thinner than nexine; columella invisible under LM.
Ornamentation:	Psilate (LM). Slightly rugulate with sparsely minute puncta on mesocolpia, puncta circular, smaller than 0.5 μm ; psilate on apocolpia (SEM).
Included taxa:	<i>Planchonella obovata</i> (R. Br.) Pierre – ຈາໄຊ (ຈິນ, ສູຮາມຄູ່ຮ້ານີ); ໂກງກາງບກ (ຫລຸນວິ, ຮະນອງ); ຈັນທິຕສອ (ກລາງ); ທີໄຣ (ປັດຕານີ); ພັກກາບກ (ໄຕ້); ໂພອາຄໍຍ (ເຊີຍໃໝ່, ຮະນອງ); ມະດິນທරາຍ (ສົງຂລາ); ສັ້ນຂວານ (ລຳປາງ); ອູ້ງໄກ໌ (ສຸມູທຽບປະກາກ) (SAPOTACEAE) (Plate 58 A-J)

4.2.41 *Pluchea indica* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.70)-0.87-(1.01)
Shape class:	Oblate to prolate spheroidal
Size class:	Small $P=(14.80)-17.60-(20.80) \mu\text{m}$, $E=(15.00)-20.43-(25.00) \mu\text{m}$
Polar area index:	(0.29)-0.44-(0.54)
Polar outline:	Circular, circular-triangular or triangular with slightly convex sides
Equatorial outline:	Circular to circular-elliptic
Apertures:	Ectoapertures – colpi, (8.80)-12.51-(19.20) X (0.80)-1.70-(3.00) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate. Endoapertures – colpi, lalongate oblong or elliptic with obtuse equatorial ends, or lalongate rhomboidic with acute equatorial ends and rarely diffused, (2.50)-3.23-(4.50) X (4.20)-6.23-(9.60) μm , margin distinct.

Exine:	Tectate perforate; exine thickness (1.20)-1.58-(2.00) μm ; sexine thicker than nexine; columellae distinct, clearly seen on both surface view and optical section.
Ornamentation:	Echinate, echinae conical with point end, (2.20)-3.03-(4.00) X (2.20)-3.33-(4.80) μm (LM), puncta present on echinus bases; area between echinae granulate and perforate, puncta irregular in size and shape, puncta bigger at echinae base, circular, polygonal or oblong, puncta smaller than 0.5 μm (SEM).
Included taxa:	<i>Melanthera biflora</i> (L.) Wild – ผักกระดทะเด (กทม.) (ASTERACEAE) (Plate 59 A-J)

Pluchea indica (L.) Less. – ขลุ่ย (กลาง); ขลุ่ย (ใต้); หนวดจี้วัว, หนวดจี้วัว, หนวดจี้วัว (อุดรธานี); หนวดวัว (กทม., อุดรธานี) (ASTERACEAE) (Plate 60 A-J)

Key to subtypes:

- | | | |
|----|---|-----------------------------------|
| 1a | Endoapertures Ialongate rhomboidic, equatorial ends acute or rarely diffuse..... | <i>Melanthera biflora</i> subtype |
| 1b | Endoapertures Ialongate oblong or Ialongate elliptic, equatorial ends obtuse..... | <i>Pluchea indica</i> subtype |

4.2.42 *Pyrrosia adnascens* type

Spore class:	Monolete
Dispersal unit:	Monad
Polarity:	Heteropolar
P/E ratio:	(0.52)-0.61-(0.75)
Shape class:	Oblate to suboblate
Size class:	Small to medium sized $P=(22.40)-29.39-(37.50) \mu\text{m}$, $E=(40.20)-47.98-(62.80) \mu\text{m}$
Arm length/radius:	-
Shape:	Ellipsoidal or boat-shape

Laesura:	Monolete, indistinct, (0.60)-0.93-(1.50) X (12.80)-19.86-(29.20) µm.
Sclerine:	Sclerine thickness (1.80)-2.23-(3.20) µm; perine thicker than exospore.
Ornamentation:	Gemmae and verrucate, gemmae and verrucae different in size; or echinate, spine shape conical with point end, some echinae slightly recurved, (5.80)-8.67-(15.50) X (5.80)-8.34-(13.20) µm, some grains echinae form like large gemmae, gemmae present on area between echinae, gemmae different in size (LM and SEM).
Included taxa:	<i>Pyrrosia adnascens</i> (Sw.) Ching – ผักปีกไก่ (เชียงราย); เฟินญี่ปุ่น (กทม.) (POLYPODIACEAE) (Plate 61 A-H)

Pyrrosia piloselloides (L.) M.G. Price – กิ่บม้าลม (เชียงใหม่, เชียงราย); เกล็ดนาคราช (กลาง, เดย์); มันเหี้ย (ชลบุรี) (POLYPODIACEAE) (Plate 62 A-H)

Key to subtypes:

- 1a Ornamentation gemmate and verrucate.....*Pyrrosia adnascens* subtype
- 1b Ornamentation echinate, some grains echinae form like large gemmae, gemmae present on area between echinae.....*Pyrrosia piloselloides* subtype

4.2.43 *Scaevola taccada* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.97)-1.07-(1.16)
Shape class:	Oblate spheroidal to subprolate
Size class:	Medium sized to large $P=(35.50)-45.90-(50.00)$ µm, $E=(36.50)-42.74-(45.50)$ µm
Polar area index:	(0.23)-0.28-(0.31)

Polar outline:	Circular or subcircular
Equatorial outline:	Circular to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (26.80)-37.78-(42.00) X (4.60)-5.91-(8.20) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute or obtuse; costa ectocolpi present; colpus membrane finely granulate. Endoapertures – colpi, lalongate elliptic or lalongate oblong, some grains equatorial ends diffused, (4.00)-7.42-(9.50) X (17.50)-20.69-(25.40) μm , margin distinct; costae endocolpi present, somewhat indistinct.
Exine:	Tectate perforate; exine thickness (2.80)-3.00-(3.20) μm ; sexine thicker than nexine; columellae distinct, clearly seen on both surface view and optical section, columellae polygonal or rarely circular when seen on surface view.
Ornamentation:	Psilate (LM). Perforate and granulate, puncta circular, smaller than 0.5 μm (SEM).
Included taxa:	<i>Scaevola taccada</i> (Gaertn.) Roxb. – รักทะเล (ชุมพร); โ Ihrā (กลาง, สงขลา); บงบัง (มลายู-ภูเก็ต) บ่บัง (ใต้) (GOODENIACEAE) (Plate 63 A-J)

4.2.44 *Scolopia macrophylla* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.90)-1.12-(1.43)
Shape class:	Oblate spheroidal to prolate
Size class:	Small $P=(14.20)-15.56-(17.20) \mu\text{m}$, $E=(12.00)-13.95-(16.40) \mu\text{m}$
Polar area index:	(0.24)-0.30-(0.33)
Polar outline:	Circular-triangular
Equatorial outline:	Elliptic to circular-elliptic

Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (10.80)-11.68-(13.50) X (0.80)-1.40-(2.80) μm , margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; colpus membrane densely granulate; costa ectocolpi present.
	Endoapertures – colpi, lalongate elliptic, some grains equatorial ends diffused, sometimes endoaperture indistinct, (1.20)-1.72-(2.00) X (2.50)-3.39-(4.20) μm , margin (in)distinct.
Exine:	Semitectate; exine thickness (0.80)-1.11-(1.50) μm ; sexine as thick as or thinner than nexine; columellae obscure.
Ornamentation:	Microreticulate (LM), lumina irregular in size and shape, circular, polygonal and oblong; muri angulated or smooth, narrower at the top and gradually broader below (SEM).
Included taxa:	<i>Scolopia macrophylla</i> (W. & A.) Clos – ຕະບັນນິ້າ, ຕະບັນທະເດ (ນາງວິວາສ); ຍຶລາໄກ້ (ມລາຍ-ນາງວິວາສ) (SALICACEAE) (Plate 64 A-J)

4.2.45 *Scyphiphora hydrophyllacea* type

Pollen class:	3-colpororate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.77)-0.89-(0.98)
Shape class:	Suboblate to oblate spheroidal
Size class:	Small to medium sized $P=(18.80)-21.70-(24.00) \mu\text{m}$, $E=(20.50)-24.44-(28.20) \mu\text{m}$
Polar area index:	(0.14)-0.23-(0.29)
Polar outline:	Triangular-circular; angulaperturate
Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (14.50)-18.74-(22.60) X (2.50)-3.36-(3.80) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate; costa ectocolpi present. Mesoaperture – pori, lolongate elliptic or subcircular, (2.50)-5.75-(8.00) X (2.40)-

3.97-(5.60) μm , margin distinct, protruding; costa mesopori present. Endoapertures – pori, lalongate elliptic with diffused equatorial ends, (5.20)-8.23-(10.50) X (7.80)-12.35-(15.00) μm , margin distinct; costa endopori present, some grains costae indistinct.

- Exine: Semitectate; exine thickness (1.50)-1.68-(2.20) μm , generally increase toward aperture; sexine thicker than nexine; columellae distinct, clearly seen on optical section than on surface view.
- Ornamentation: Microreticulate (LM). Microreticulate, lumina polygonal or circular, irregular in size and shape, heterobrochate; muri psilate (SEM).
- Included taxa: *Scyphiphora hydrophyllacea* C.F. Gaertn. – จี๊จำ (กทม.); ซี๊จำ (ตรัง); ซี๊จำ (มา喻-ภูเก็ต, สตูล); รังแค (ชุมพร) (RUBIACEAE) (Plate 65 A-J)

4.2.46 *Sesuvium portulacastrum* type

- Pollen class: 3-colpate
- Dispersal unit: Monad
- Polarity: Isopolar
- P/E ratio: (0.76)-0.89-(0.97)
- Shape class: Suboblate to oblate spheroidal
- Size class: Small
 $P=(16.00)-18.09-(20.40) \mu\text{m}$, $E=(18.00)-20.45-(22.80) \mu\text{m}$
- Polar area index: (0.18)-0.25-(0.31)
- Polar outline: Circular to trilobate
- Equatorial outline: Elliptic to circular-elliptic
- Apertures: Colpi, slightly shorter than polar axis, (16.60)-14.70-(12.20) X (3.00)-4.83-(6.40) μm , wide, margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate.

Exine:	Tectate perforate; exine thickness (0.60)-1.05-(1.50) μm ; sexine as thick as or thicker than nexine; columellae distinct, clearly seen on both surface view and optical section.
Ornamentation:	Perforate (LM). Granulate-perforate, pore irregular in size and shape, pore circular or polygonal, pore smaller than 0.5 μm (SEM).
Included taxa:	<i>Sesuvium portulacastrum</i> (L.) L. – ដំរើបីមេគាល់ (ធម្ពជានុវត្តិ); ផែងពោម ធម៌គាល់ (មួនព្រ) (ALIZOACEAE) (Plate 66 A-J)

4.2.47 *Shirakiopsis indica* type

Pollen class:	3-colporate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(1.12)-1.20-(1.27)
Shape class:	Prolate spheroidal to subprolate
Size class:	Small to medium sized $P=(23.60)-27.69-(30.20) \mu\text{m}$, $E=(20.00)-23.16-(26.60) \mu\text{m}$
Polar area index:	(0.14)-0.21-(0.28)
Polar outline:	Triangular-circular
Equatorial outline:	Elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (20.50)-22.44-(24.20) X (1.40)-1.83-(2.50) μm , margin distinct, widen at equator and tapering toward poles, polar ends acute; margo present, distinct, psilate; colpus membrane densely granulate; costa ectocolpi present. Endoapertures – pori, sometimes indistinct, elongate elliptic, equatorial ends diffused, (2.00)-3.41-(5.00) X (3.50)-4.81-(5.80) μm , margin distinct or indistinct; costa endopori present, some grains costae indistinct.
Exine:	Semitectate; exine thickness (1.80)-1.86-(2.00) μm ; sexine thicker than nexine; columellae distinct, clearly seen on both surface

view and optical section, columellae circular when seen on surface view.

Ornamentation: Microreticulate, lumina circular or elliptic, different in size (LM); muri smooth, narrower (SEM).

Included taxa: *Shirakiopsis indica* (Willd.) Esser – សមុទ្ធអេក់, ករាជុត្ត (កតាង); កីវិ៍ នរោះ, គីវិ៍រ៉ុក, គីវិ៍រ៉ុប, គីវិ៍រ៉ុលា (មគាយូ-ពីី) (EUPHORBIACEAE) (Plate 67 A-J)

4.2.48 *Sonneratia griffithii* type

Pollen class: 3-porate

Dispersal unit: Monad

Polarity: Isopolar

P/E ratio: (1.16)-1.44-(1.79)

Shape class: Subprolate to prolate

Size class: Small to medium sized

$P=(27.50)-34.21-(39.00) \mu\text{m}$, $E=(18.00)-23.94-(29.20) \mu\text{m}$

Polar area index: -

Polar outline: Triangular with protruding pore on each side, and with convexity on the middle part of each side, then appearing as 6-lobate, hexangular, circular-hexangular, or circular with protruding pore on each side.

Equatorial outline: Elliptic-oblong to elliptic, rhomboidal-elliptic, or barrel-shape.

Apertures: Pori – circular or subcircular, (3.20)-4.36-(7.50) X (3.50)-4.56-(6.40) μm ; opercula present, gemmate, gemma different in size and shape; annulus present, distinct.

Exine: Tectate; exine thickness (1.80)-2.43-(3.80) μm , relatively thicker at apocolpium; sexine thicker than nexine; columellae distinct, clearly seen on both surface view and optical section, more distinct on apocolpium surface view, columellae circular or polygonal when seen on surface view; irregular in size.

Ornamentation: Granulate to gemmate; apoporia psilate, columellae present under tectum on apoporia when see on polar view (LM). Granulate to gemmate, granules or gemmae irregular in size and shape; apoporia psilate with sparsely perforate or foveolate (SEM).

Included taxa: *Sonneratia alba* Sm. – ลำแพน (กลาง, สตูล); รำปีด (มลายู-สตูล); ปาด (พังงา, ภูเก็ต); บุแม (มลายู-นราธิวาส) (LYTHRACEAE) (Plate 68 A-J)

Sonneratia caseolaris (L.) Engl. – ลำพู (กลาง, ตรัง) (LYTHRACEAE) (Plate 69 A-J)

Sonneratia griffithii Kurz. – ลำแพนหิน (จันทรบุรี, ตราด); ลำแพนทะเล (กลาง); ลำแพน (กลาง, สตูล) (LYTHRACEAE) (Plate 70 A-J)

Sonneratia ovata Backer. – ลำแพน (กลาง, สตูล); ลำพูพิน (กลาง) (LYTHRACEAE) (Plate 71 A-J)

Key to subtypes:

- 1a Ridges on mesoporum present.....2
- 1b Ridges on mesoporum absent.....3
- 2a Polar outline triangular with protruding pore on each side, triangular with convexity on the middle part of each side, or 6-lobate; gemmate-fossulate on ridge at mesoporum*Sonneratia alba* subtype
- 2b Polar outline triangular with protruding pore on each side, triangular with convexity on the middle part of each side, or hexangular; fossulate on ridge at mesoporum*Sonneratia griffithii* subtype
- 3a Polar outline circular-hexangular or circular with protruding pore on each side, or triangular with convex sides; equatorial outline elliptic or rhomboidic-elliptic, very tapering toward apoporium.....*Sonneratia caseolaris* subtype

- 3b Polar outline hexangular or triangular with protruding pore on each side; equatorial outline elliptic-oblong, or barrel-shape.....*Sonneratia ovata* subtype

4.2.49 *Stenochlaena palustris* type

Spore class:	Monolete
Dispersal unit:	Monad
Polarity:	Heteropolar
P/E ratio:	(0.50)-0.62-(0.70)
Shape class:	Peroblate to oblate
Size class:	Small to medium sized P=(20.00)-24.74-(29.40) μm , E=(35.20)-39.91-(49.20) μm
Arm length/radius:	-
Shape:	Ellipsoidal or boat-shape
Laesura:	Monolete, (1.80)-2.20-(3.00) X (18.00)-25.42-(32.00) μm .
Sclerine:	Sclerine thickness (1.40)-1.78-(2.20) μm ; perine thicker than exospore.
Ornamentation:	Verrucate or short baculate present only on distal surface, proximal surface and interbaculate area psilate (LM and SEM).
Included taxa:	<i>Stenochlaena palustris</i> (Burm. f.) Bedd. – ปรงสวน, ผักยอดಡeng (กลาง); นีดิง (มลายู-นราธิวาส); ปากุ้มะดิง (มลายู-ยะลา); ผักกูดడeng (กทม., ลำปาง); ผักกูดมอมยุ (กทม.); คำเท็ง (ยะลา); คำมะเท็ง (นครราชสีมา, ประจวบคีรีขันธ์) (BLECHNACEAE) (Plate 72 A-H)

4.2.50 *Suaeda maritima* type

Pollen class:	Polypantoporate
Dispersal unit:	Monad
Polarity:	Apolar
P/E ratio:	(1.00)-1.03-(1.06)
Shape class:	Oblate spheroidal to prolate spheroidal
Size class:	Small Diameter (14.80)-17.06-(18.80) X (14.20)-16.64-(18.50) μm

Polar area index:	-
Outline:	Circular or subcircular
Apertures:	Pori circular or subcircular, (1.20)-1.65-(2.00) X (1.00)-1.62-(2.00) µm; operculum microechinate.
Exine:	Tectate perforate; exine thickness (1.50)-1.78-(2.00) µm; sexine thicker than nexine; columellae distinct, clearly seen on optical section than on surface view.
Ornamentation:	Granulate (LM). Perforate and microechinate, pore smaller than 0.5 µm (SEM).
Included taxa:	<i>Suaeda maritima</i> (L.) Dumort. – ชะคราม (กลาง, หนองคาย); ชักกระ (กลาง); ล่ากระ (สมุทรสาคร) (AMARANTHACEAE) (Plate 73 A-F)

4.2.51 *Terminalia catappa* type

Pollen class:	3-colporate with 3-pseudocolpate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(1.01)-1.15-(1.37)
Shape class:	Prolate spheroidal to prolate
Size class:	Small $P=(14.00)-15.46-(17.20)$ µm, $E=(12.20)-13.45-(15.20)$ µm
Polar area index:	(0.18)-0.26-(0.34)
Polar outline:	Hexangular with constriction on each side or 6-lobate
Equatorial outline:	Elliptic to circular-elliptic
Apertures:	Ectoapertures – colpi, slightly shorter than polar axis, (9.40)-11.54-(13.00) X (1.00)-1.42-(2.00) µm, very narrow, margin distinct, slightly widen at equator and tapering toward poles, polar ends acute; colpus membrane granulate. Endoapertures – colpi, lalongate elliptic to oblong-elliptic, (1.80)-2.16-(3.00) X (3.00)-3.57-(4.20) µm, margin distinct. Pseudoapertures – colpi, alternate with true apertures, as long as ectoaperture.

Exine:	Tectate imperforate; exine thickness (0.80)-1.08-(1.20) μm ; sexine as thick as nexine; columella invisible under LM.
Ornamentation:	Psilate (LM). Rugulate with scattered minute puncta, puncta smaller than 0.5 μm (SEM); pseudoaperture surface psilate (LM), granulate (SEM).
Included taxa:	<i>Terminalia catappa</i> L. – หูกวาง (กทม., เหนือ); โคน (นราธิวาส); ดัด มีอ, ตัดมีอ (ตรัง); ตาปึง (พิษณุโลก, สตูล); ตาแป๊ะ (มาเลย์-นราธิวาส); หลุมปึง (ใต้, สุราษฎร์ธานี) (COMBRETACEAE) (Plate 74 A-K)

4.2.52 *Thespesia populnea* type

Pollen class:	Polypantocolporate
Dispersal unit:	Monad
Polarity:	Apolar
P/E ratio:	1.00-(1.05)-1.15
Shape class:	Oblate spheroidal to subprolate
Size class:	Large to very large Diameter (57.20)-81.24-(111.25) X (54.00)-78.00-(103.75) μm
Polar area index:	-
Outline:	Circular or subcircular
Apertures:	Ectoapertures – colpi, very short, slightly longer than endoapertures, (4.80)-10.58-(19.20) X (0.80)-2.04-(3.50) μm , margin distinct, ends acute or obtuse; colpus membrane psilate or granulate. Endoapertures – pori, circular or subcircular, (4.00)-6.59-(9.20) X (4.00)-6.25-(8.80) μm , margin distinct; costa endopori present.
Exine:	Tectate perforate; exine thickness (2.00)-3.90-(6.40) μm ; sexine (exclude spines) thicker than nexine; columellae distinct, clearly seen on both surface view and optical section; on surface view columellae irregular in size and shape, smaller and usually circular under interspinal area, bigger and polygonal under spinal base.

Ornamentation: Echinate, echinae conical with point end, (2.80)-5.22-(9.00) X (5.50)-11.52-(19.00) μm ; cushion present at echinus bases, (6.50)-11.31-(18.20) X (1.40)-2.36-(4.00) μm ; area between echinae perforate to microreticulate (LM), tectum surface with granules (SEM).

Included taxa: *Hibiscus tiliaceus* L. – ป้อทะเด (กลาง); ขมิ้นนางมั่ว (เลย); นา (กลาง, ใต้); ปอนา (ใต้); ปอฟ้าย (กลาง, เหนือ); ผึ้งยิก (เลย); โพทะเด (กทม., เพชรบุรี) (MALVACEAE) (Plate 75 A-H)

Thespesia populnea (L.) Sol. ex Corrêa – โพทะเด (ก้านยาว) (กทม., เพชรบุรี); นาคุ (ปีตตามี, ปลาดุก-นราธิวาส); ปอกะหมัดไพร (ราชบุรี); ปอ มัดไซ (เพชรบุรี) (MALVACEAE) (Plate 76 A-H)

Thespesia populneoides (Roxb.) Kostel. – โพทะเด (ก้านยาว) (กทม., เพชรบุรี) (MALVACEAE) (Plate 77 A-H)

Key to subtypes:

- 1a Area between echinae sparsely perforate (LM), puncta circular, smaller than 0.5 μm , densely at cushion, tectum surface almost psilate with sparsely distributed granules (SEM); grains large to very large, diameter=(92.50)-102.00-(111.25) X (91.25)-99.00-(103.75) μm*Hibiscus tiliaceus* subtype
- 1b Area between echinae densely perforate to mucroreticulate (LM), puncta or lumina irregular in size and shape, circular, polygonal or oblong, tectum surface with sparsely or densely granules (SEM); grains large, diameter=(57.20)-70.86-(99.20) X (54.00)-67.50-(97.80) μm*Thespesia populnea* subtype
(Including: *Thespesia populnea*; *Thespesia populneoides*)

Remarks:

This type can be subdivided in to two subtypes by sizes and the detail of perforations. Moreover, Aperture number is not exactly counted, but it is noticeable that *Hibiscus tiliaceus* subtype seem to have more aperture number rather than *Thespesia*

populnea subtype. Within *Thespesia populnea* subtype, *T. populnea* grains have densely perforations on interspinal area while *T. populneoides* grains have sparsely perforations on interspinal area.

4.2.53 *Xylocarpus rumphii* type

Pollen class:	(3-)4(-5)-porate
Dispersal unit:	Monad
Polarity:	Isopolar
P/E ratio:	(0.81)-0.99-(1.14)
Shape class:	Suboblate to subprolate
Size class:	Small to medium sized P=(22.50)-29.89-(36.00) μm , E=(25.50)-30.28-(37.50) μm
Polar area index:	(0.39)-0.53-(0.63)
Polar outline:	Circular to circular-tetragonal or triangular with convex sides
Equatorial outline:	Circular to subcircular
Apertures:	Ectoapertures – colpi, shorter than half length of polar axis, (6.80)-10.57-(16.20) X (0.60)-1.02-(1.60) μm , margin distinct, oblong or slightly widen at equator and tapering toward poles, polar ends acute or obtuse; colpus membrane psilate; margo present, slightly protruding around ectoaperture, indistinct. Endoapertures – pori, circular or subcircular, (1.80)-3.00-(4.60) X (2.00)-3.21-(5.00) μm , margin distinct; costa endopori present, distinct.
Exine:	Tectate perforate; exine thickness (0.80)-1.29-(2.00) μm ; sexine as thick as or thicker than nexine; columella invisible under LM.
Ornamentation:	Psilate or perforate (LM). Perforate, puncta circular and elliptic, irregular in size and shape, almost smaller than 0.5 μm (SEM).
Included taxa:	<i>Xylocarpus granatum</i> J. Koenig. – ຕະບູນຫາວ, ຕະບູນ, ກະບູນຫາວ (ກລາງ, ໄສ້) (MELIACEAE) (Plate 78 A-J)

Xylocarpus moluccensis (Lam.) M. Roem. – ตะบูนดำ (กลาง);
ตะบัน (กลาง, ใต้) (MELIACEAE) (Plate 79 A-J)

Xylocarpus rumphii (Kostel.) Mabb. – ตะบัน (กลาง, ใต้)
(MELIACEAE) (Plate 80 A-L)

Remarks:

There is a variation in aperture number of these three species. Some grains of *X. granatum* are 3-aperturate grains while 5-aperture found in *X. moluccensis*. Some grains of *X. rumphii* are 3- and 5-aperturate grains. Besides, endopori of *X. granatum* are approximately 1.5 as big as endopori of *X. moluccensis*. and *X. rumphii*.

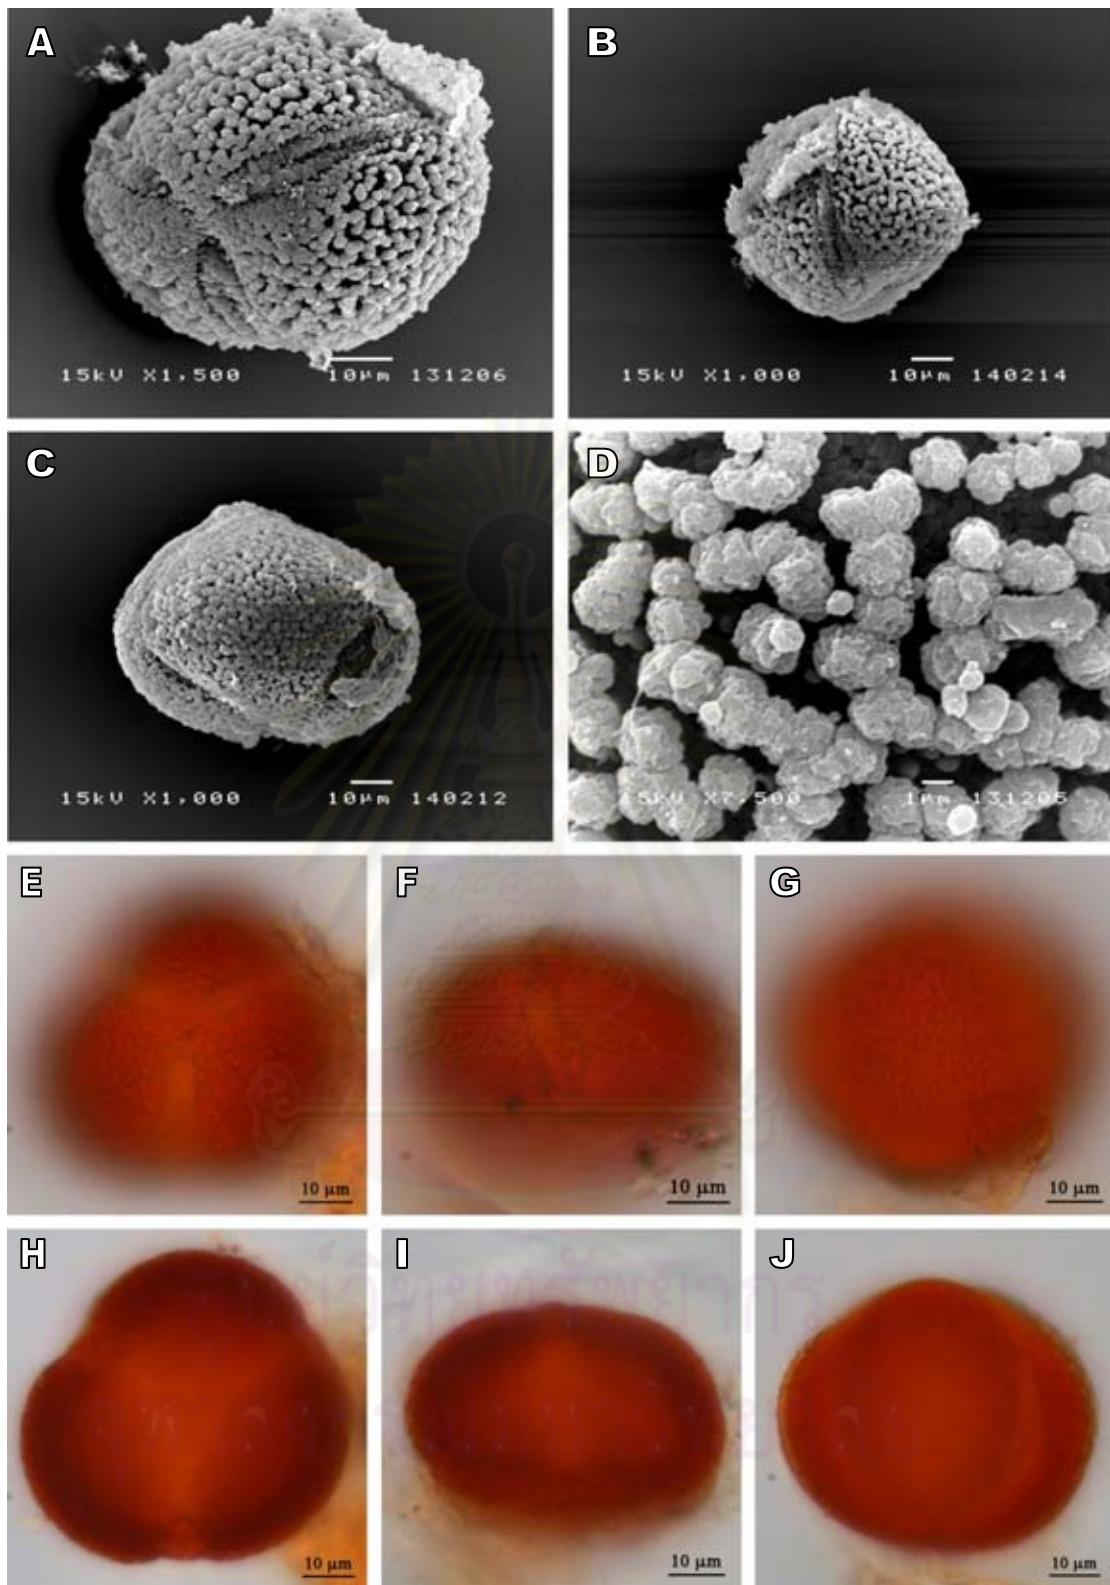

Plate 6 *Aegialitis rotundifolia* Roxb.: (A) Polar view, (B) Equatorial view, colpus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, colpus, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colpus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

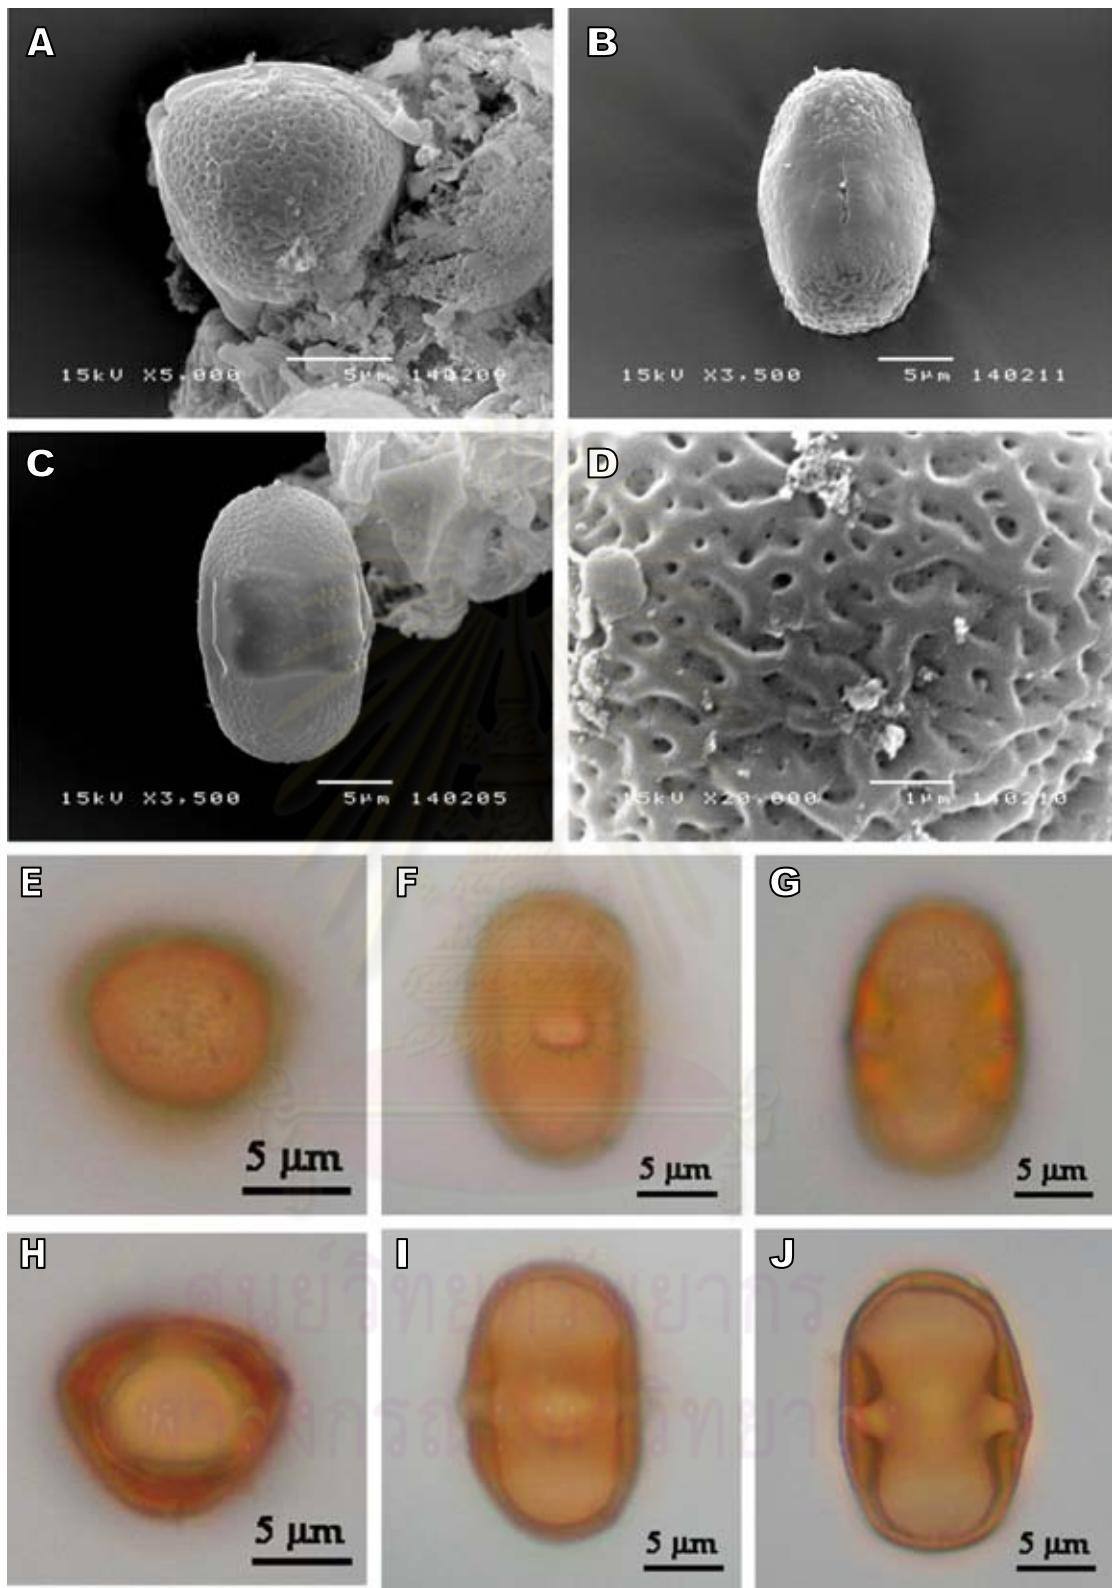

Plate 7 *Aglaia cucullata* (Roxb.) Pellegr.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Polar view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa endopori (A-D: SEM; E-J: LM).

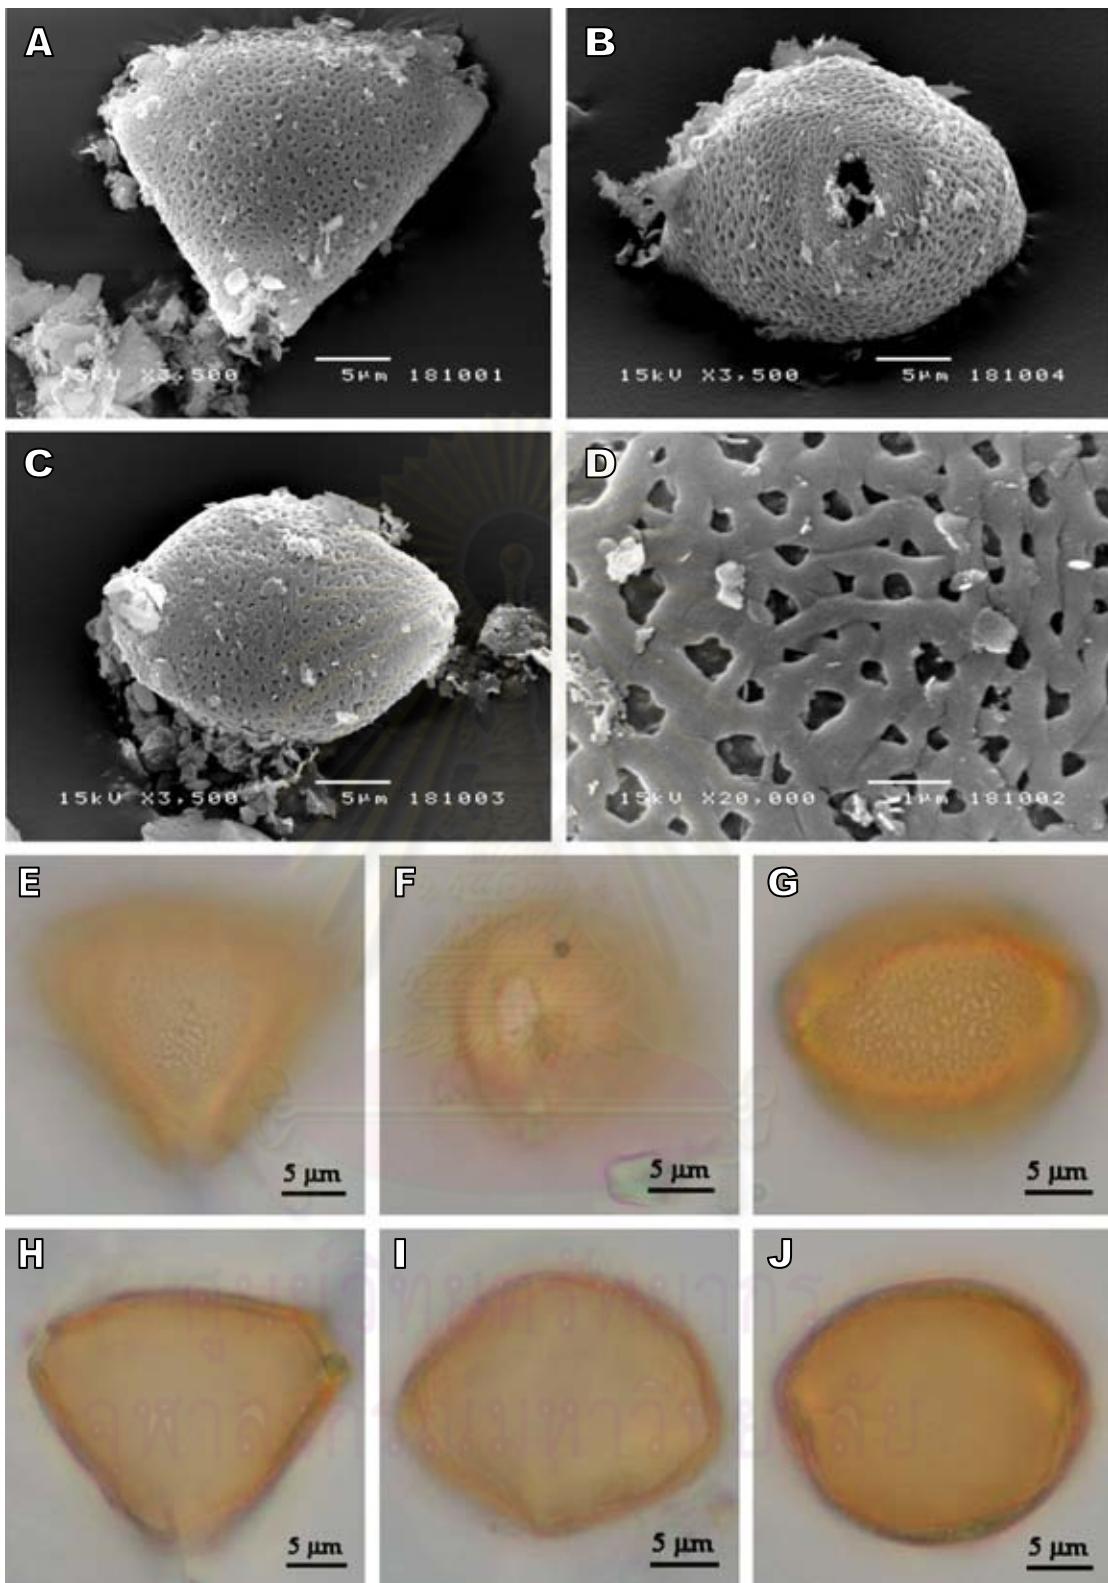

Plate 8 *Allophylus cobbe* (L.) Raeusch.: (A) Polar view, (B) Equatorial view, porus, (C) Equatorial view, mesoporum, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, porus, (G) Equatorial view, mesoporum surface, (H) Polar view, optical section, (I) Optical section under porus, (J) Optical section under mesoporum (A-D: SEM; E-J: LM).

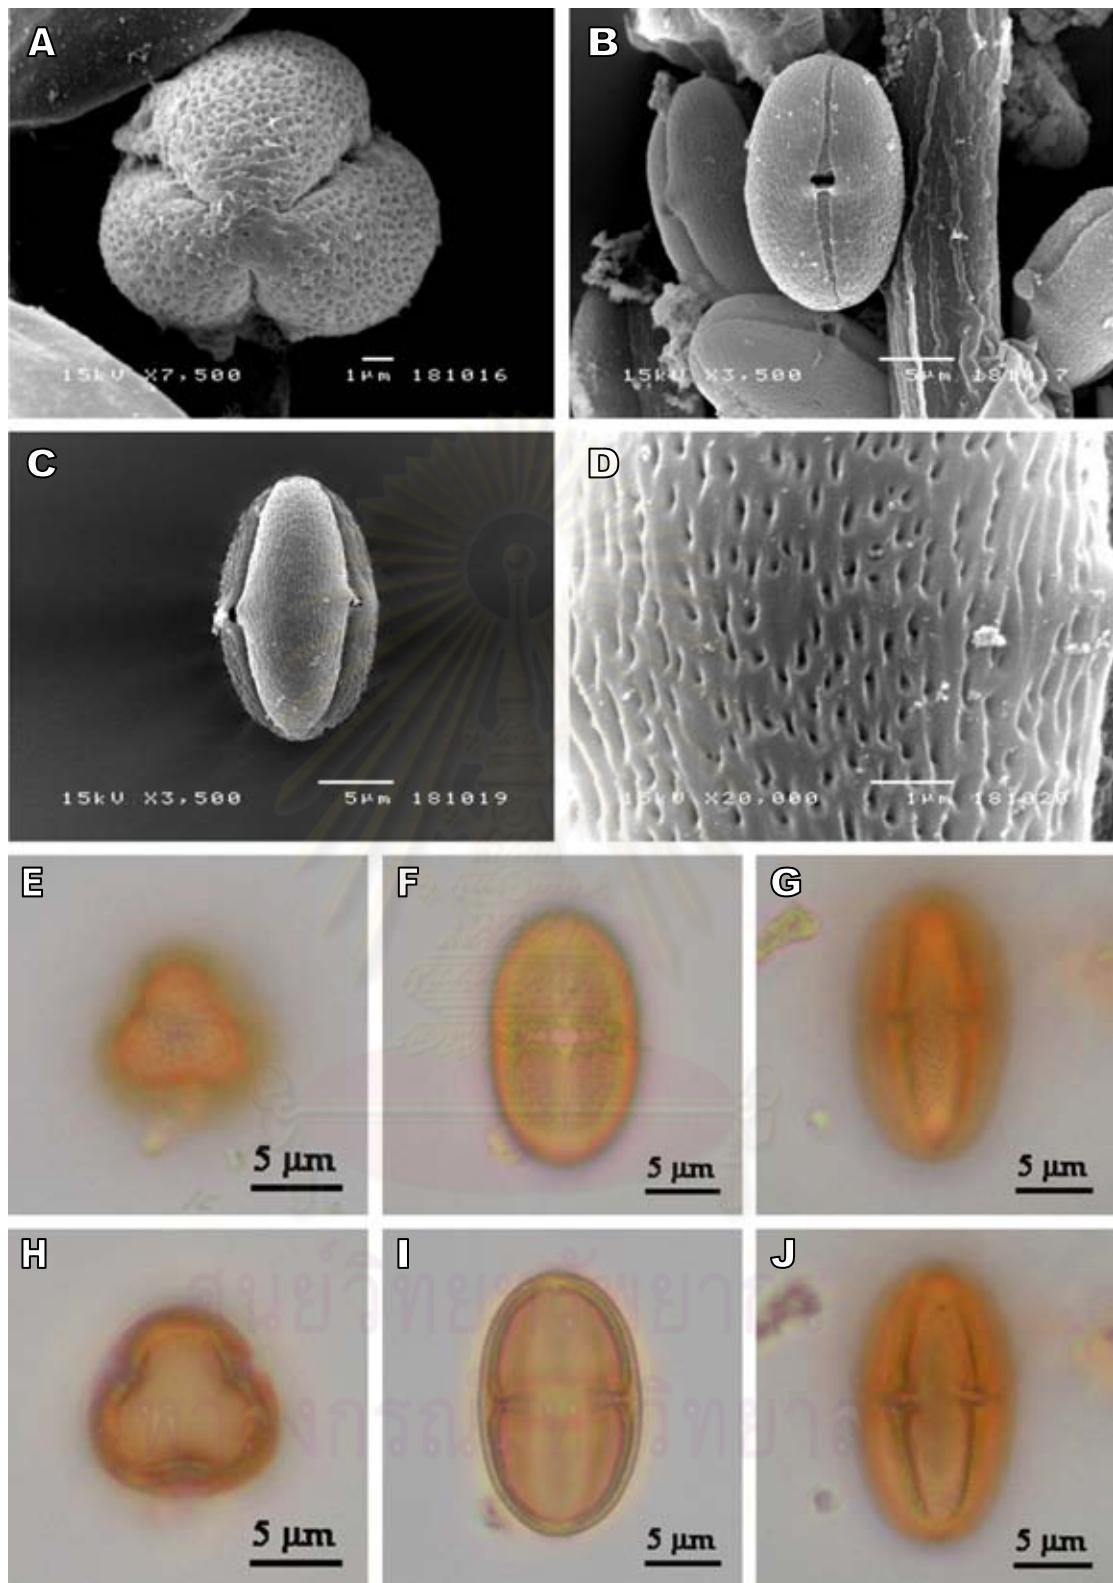

Plate 9 *Antidesma ghaesembilla* Gaertn.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

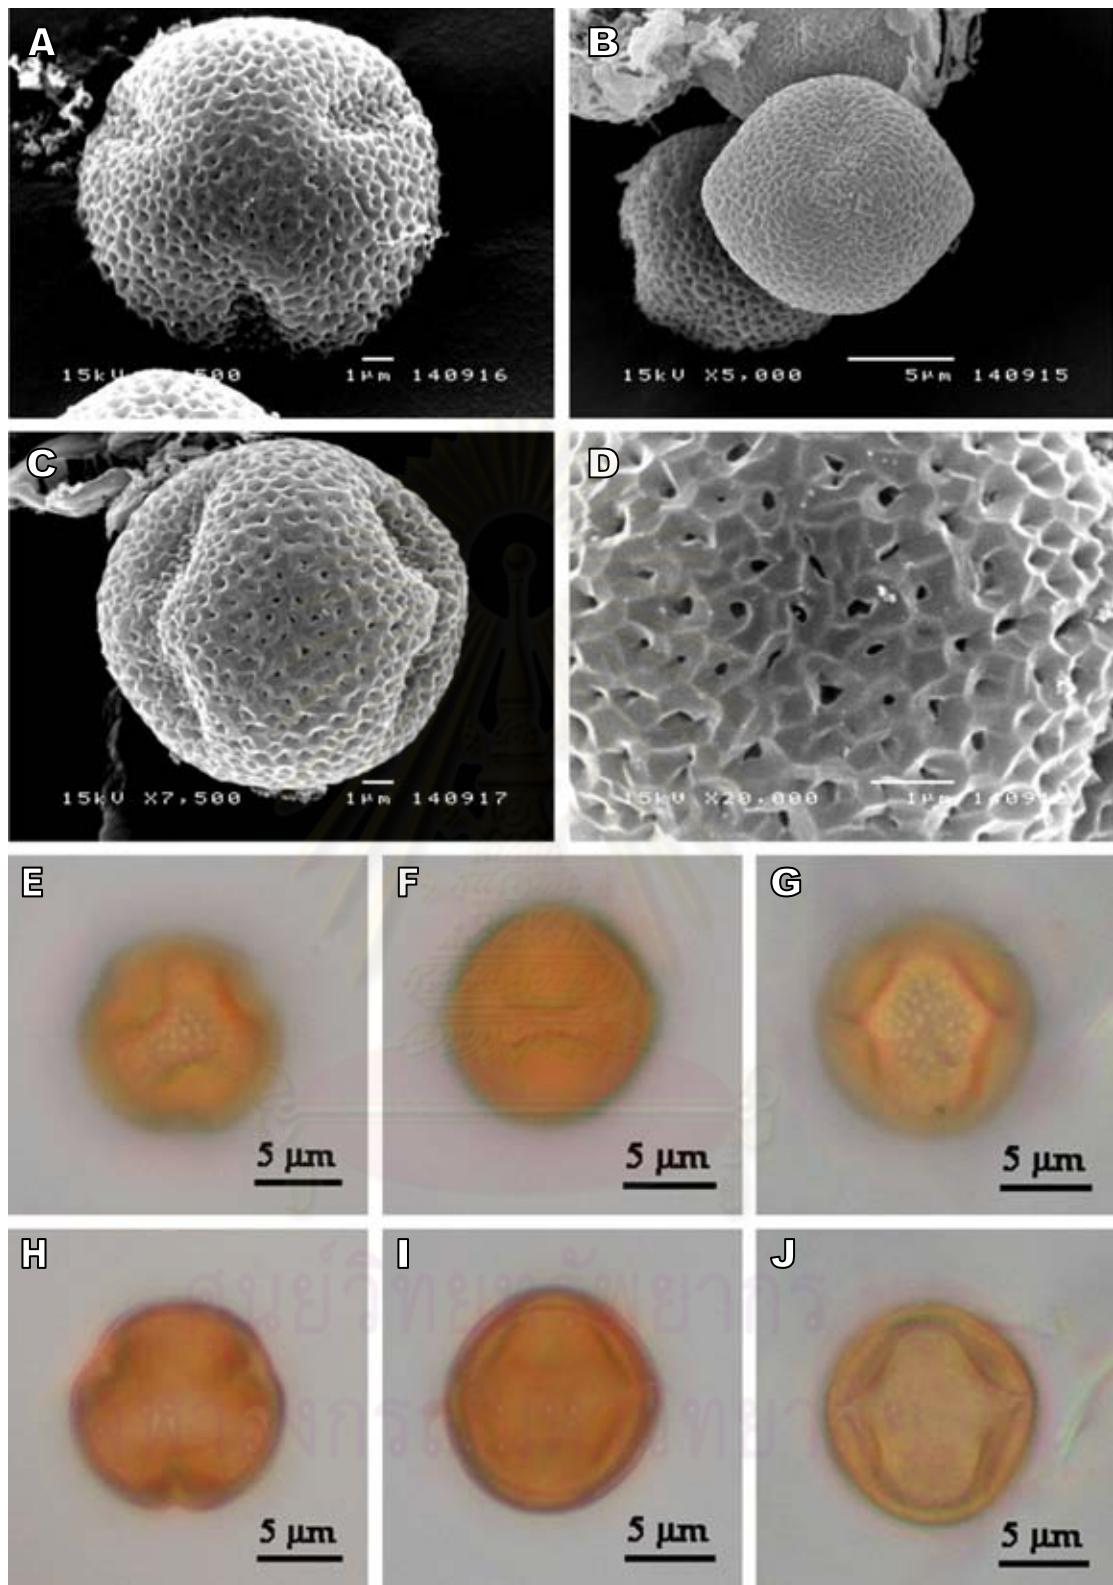

Plate 10 *Ardisia elliptica* Thunb.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

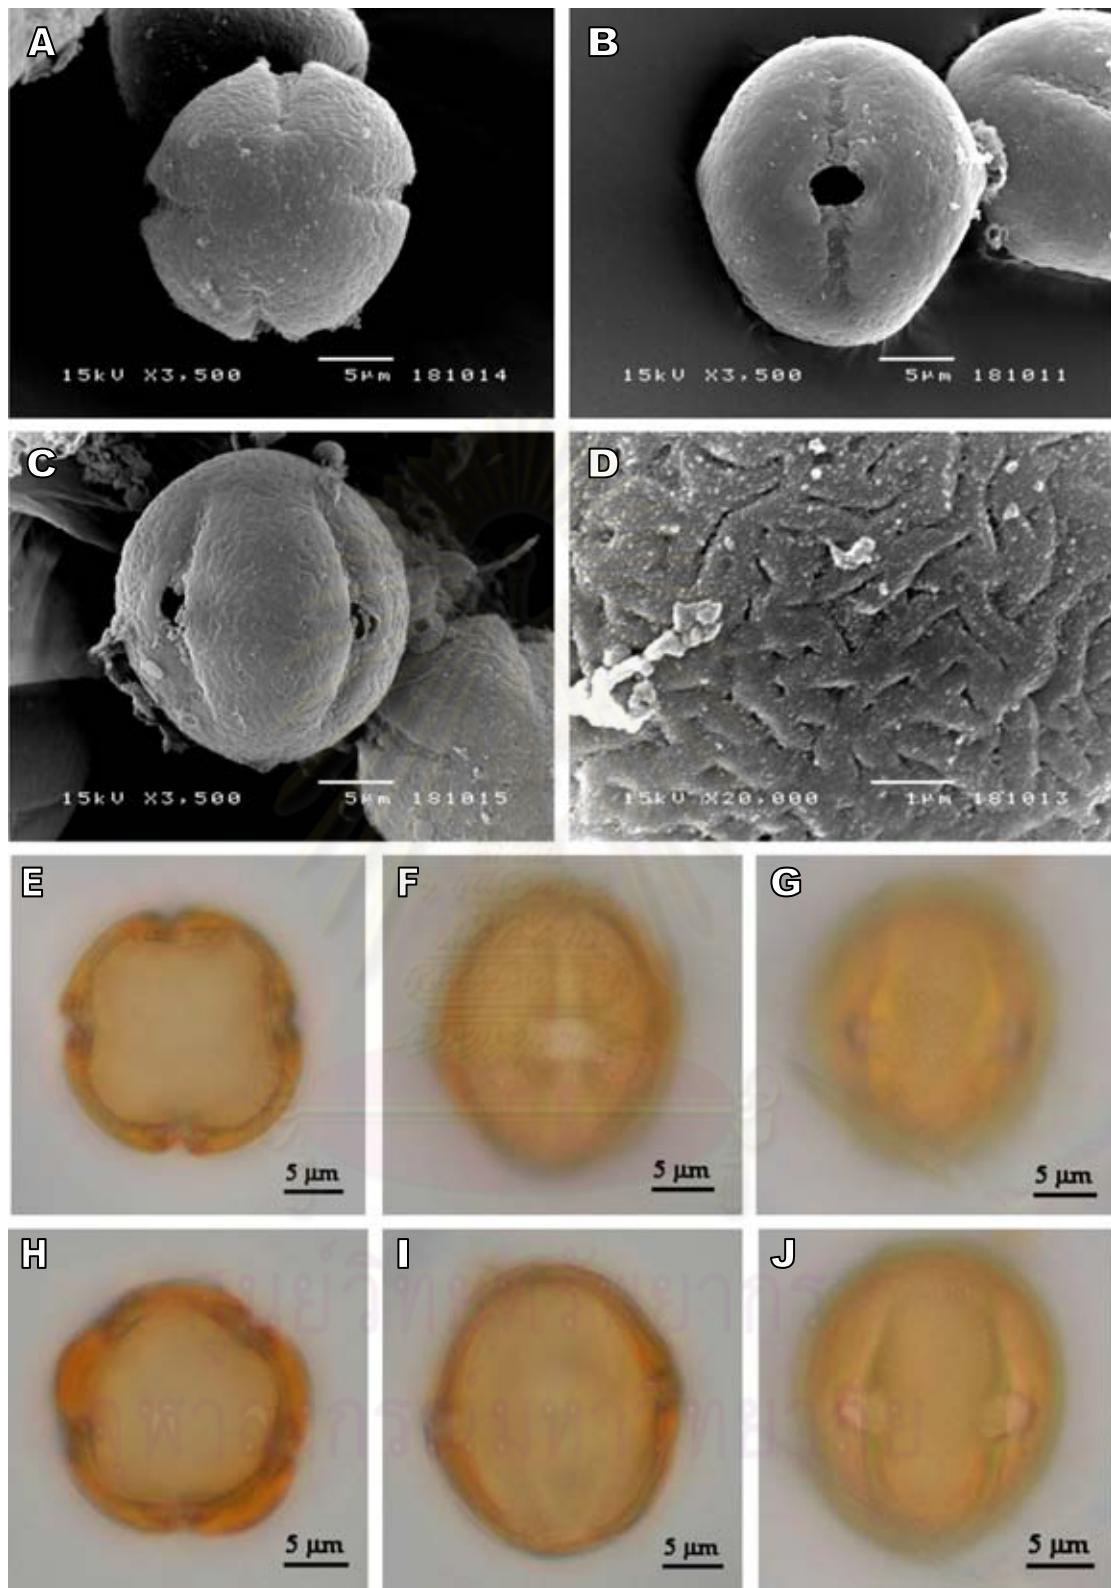

Plate 11 *Atalantia monophylla* DC.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view of 4-aperturate grain, optical section, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view of 5-aperturate grain, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

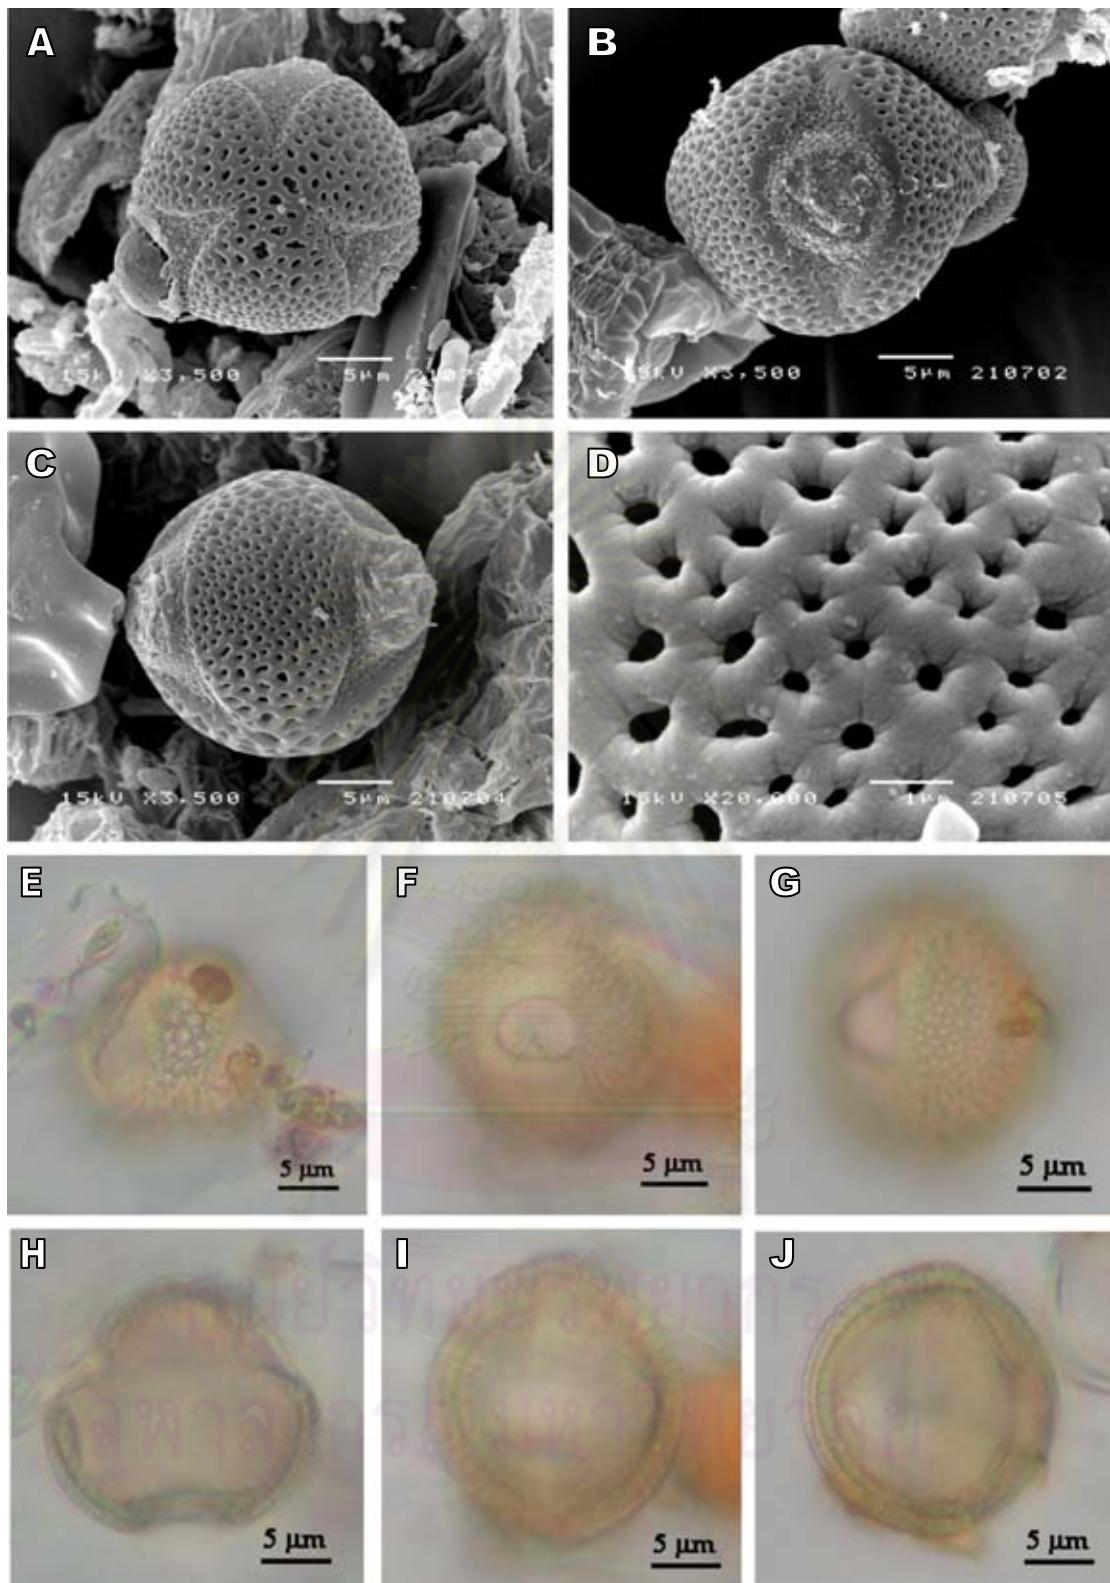

Plate 12 *Avicennia alba* Blume: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

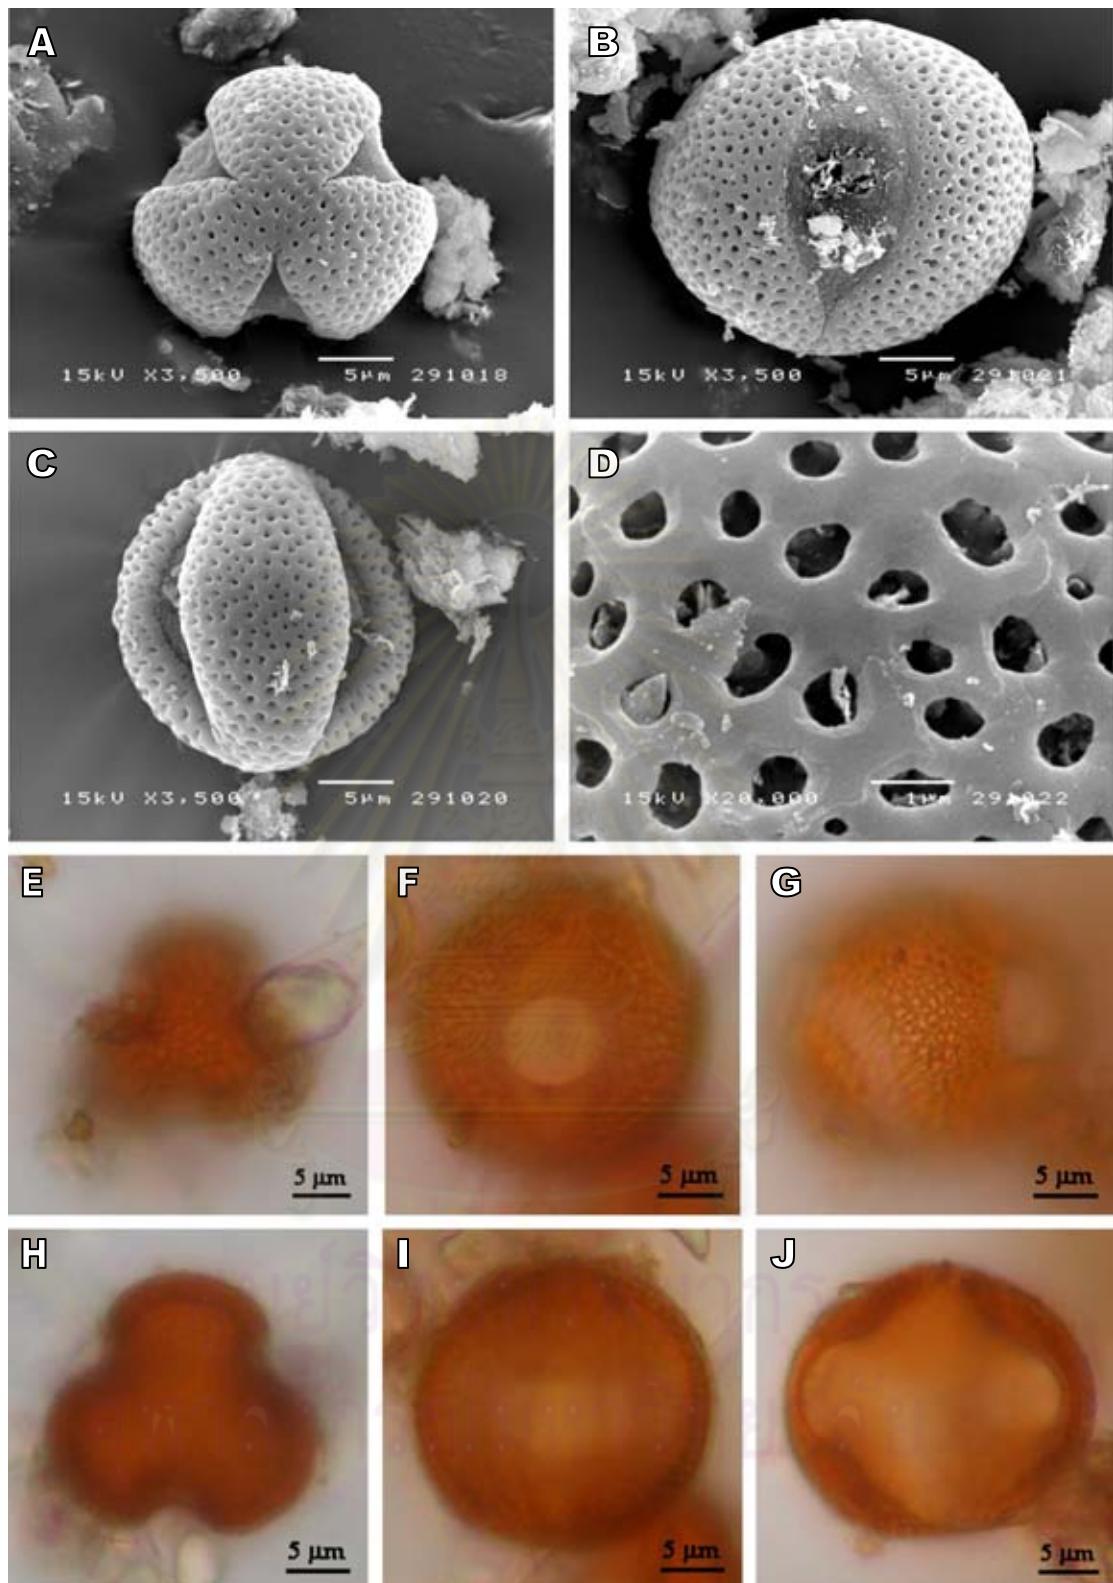

Plate 13 *Avicennia marina* (Forssk.) Vierh. : (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

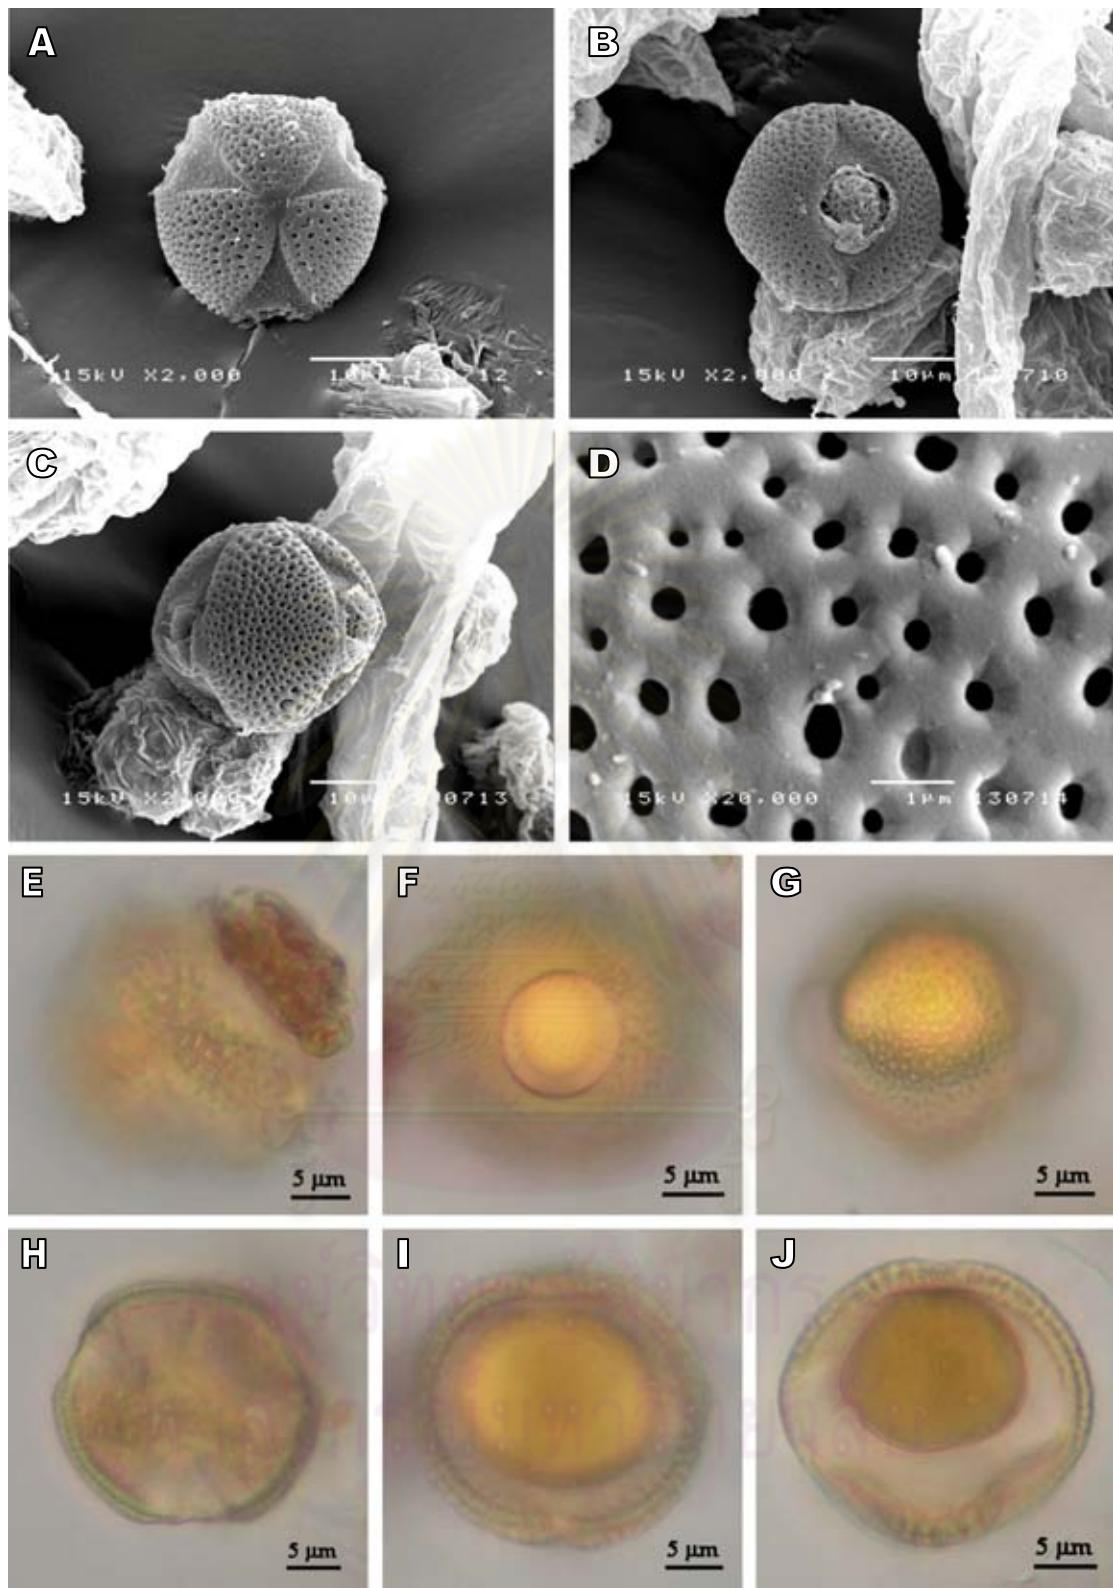

Plate 14 *Avicennia officinalis* L.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

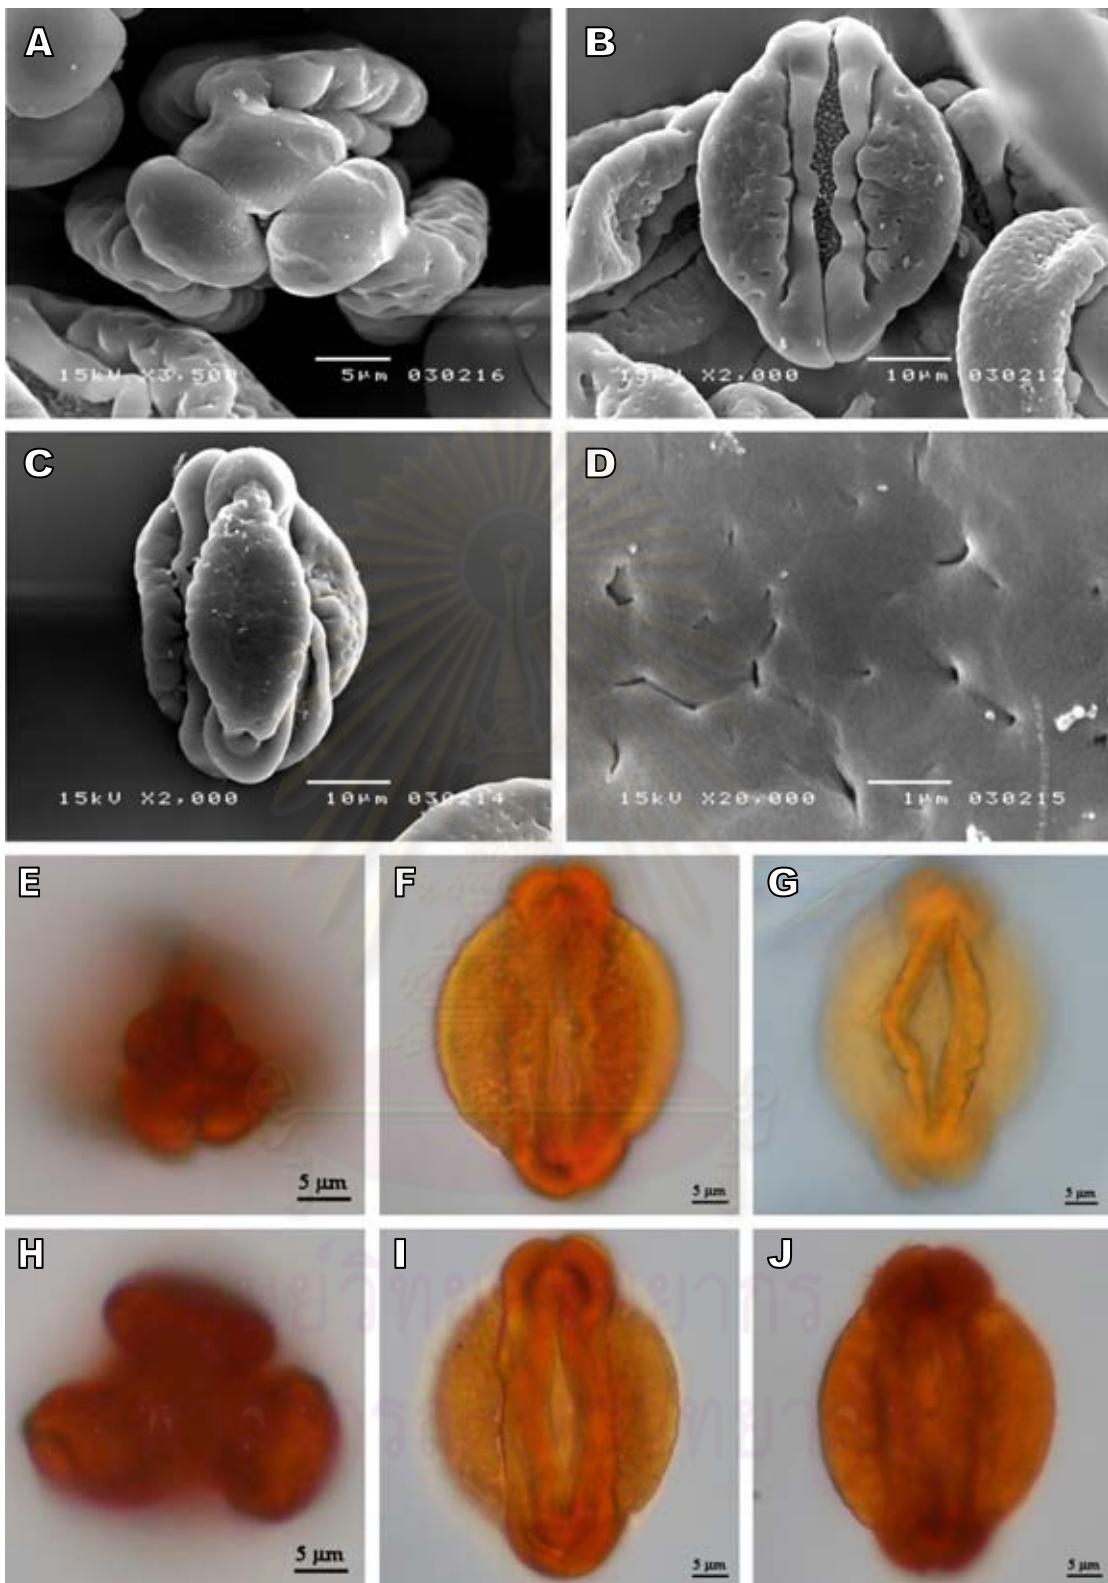

Plate 15 *Barringtonia asiatica* (L.) Kurz: (A) Polar view, (B) Equatorial view, colpus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, colpus, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colpus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

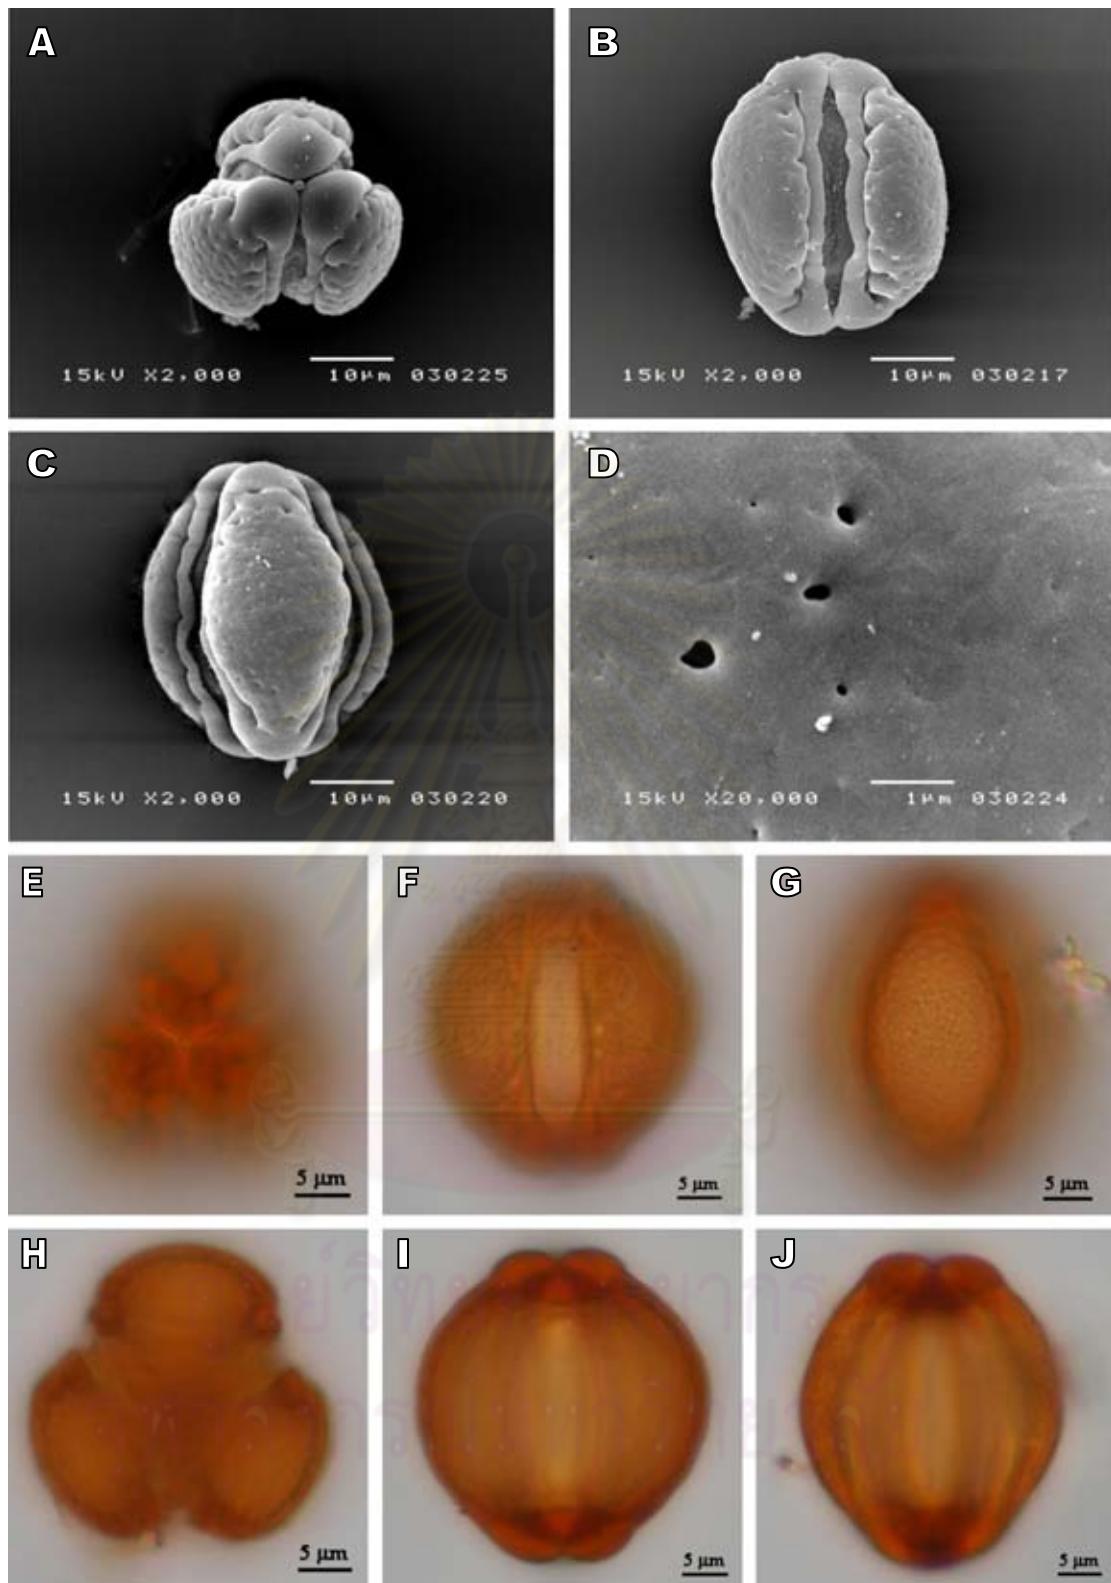

Plate 16 *Barringtonia racemosa* (L.) Spreng.: (A) Polar view, (B) Equatorial view, colpus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, colpus, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colpus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

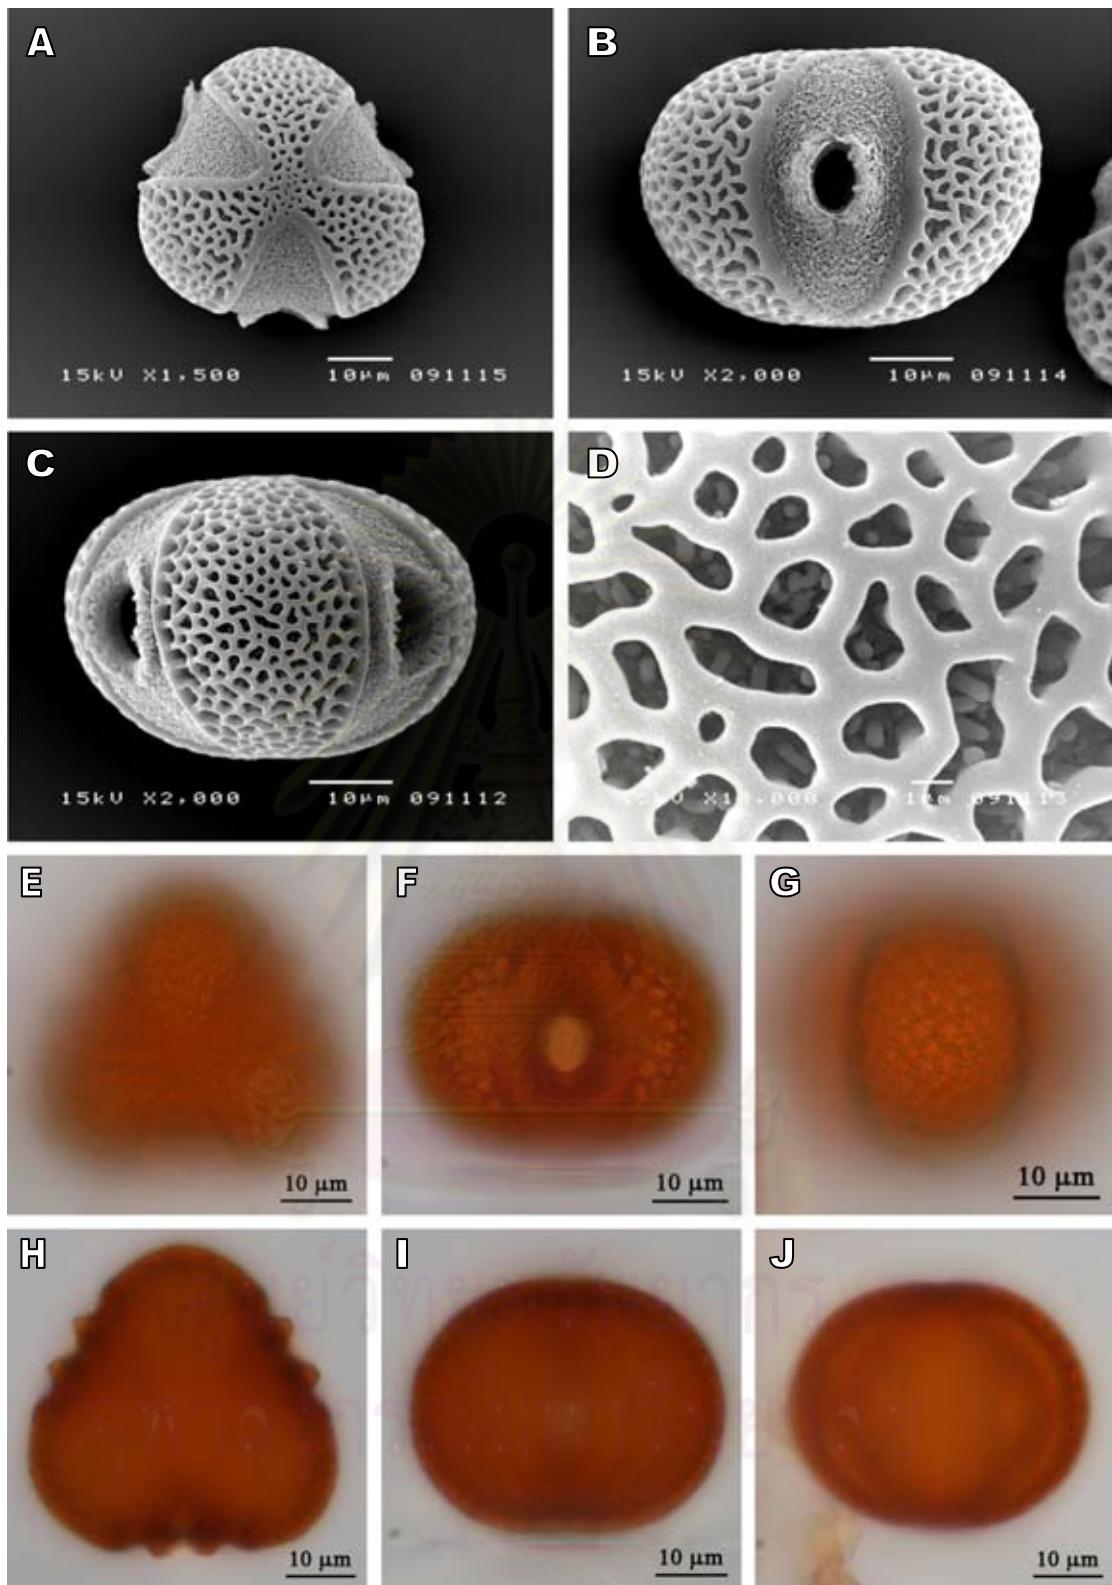

Plate 17 *Caesalpinia crista* L.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

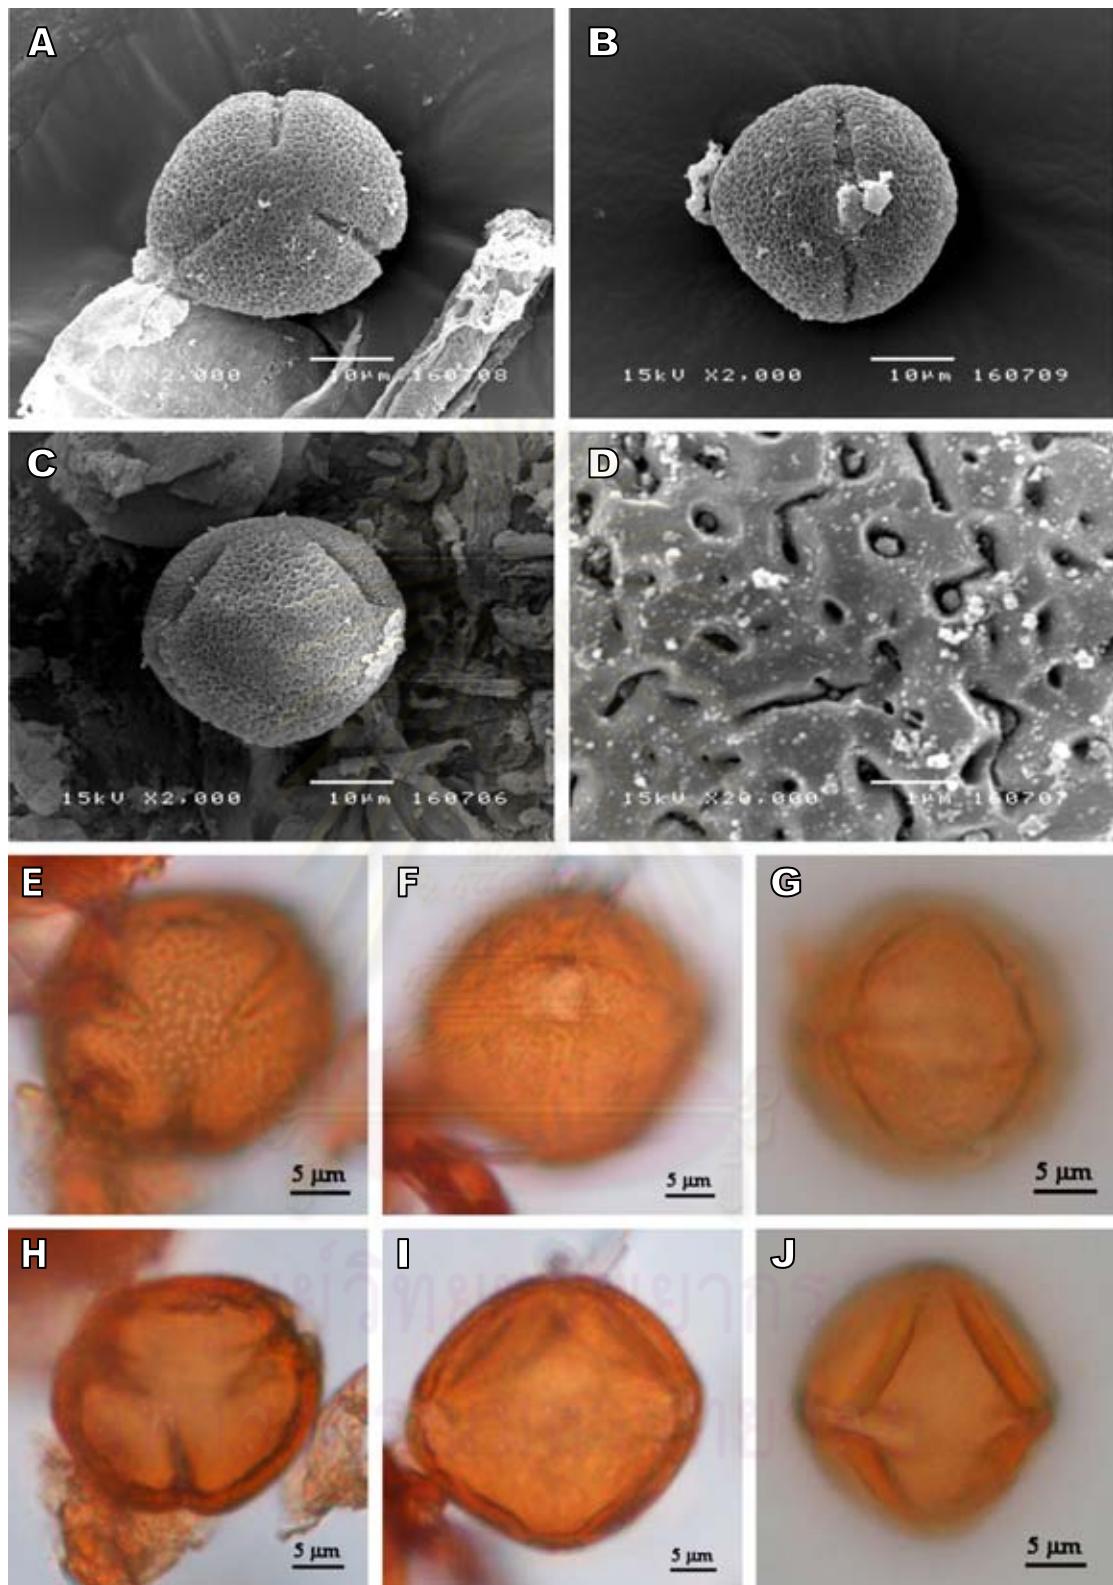

Plate 18 *Calophyllum inophyllum* L.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture lalongate elliptic with acute ends, (G) Equatorial view, endocingulum under mesocolpium, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

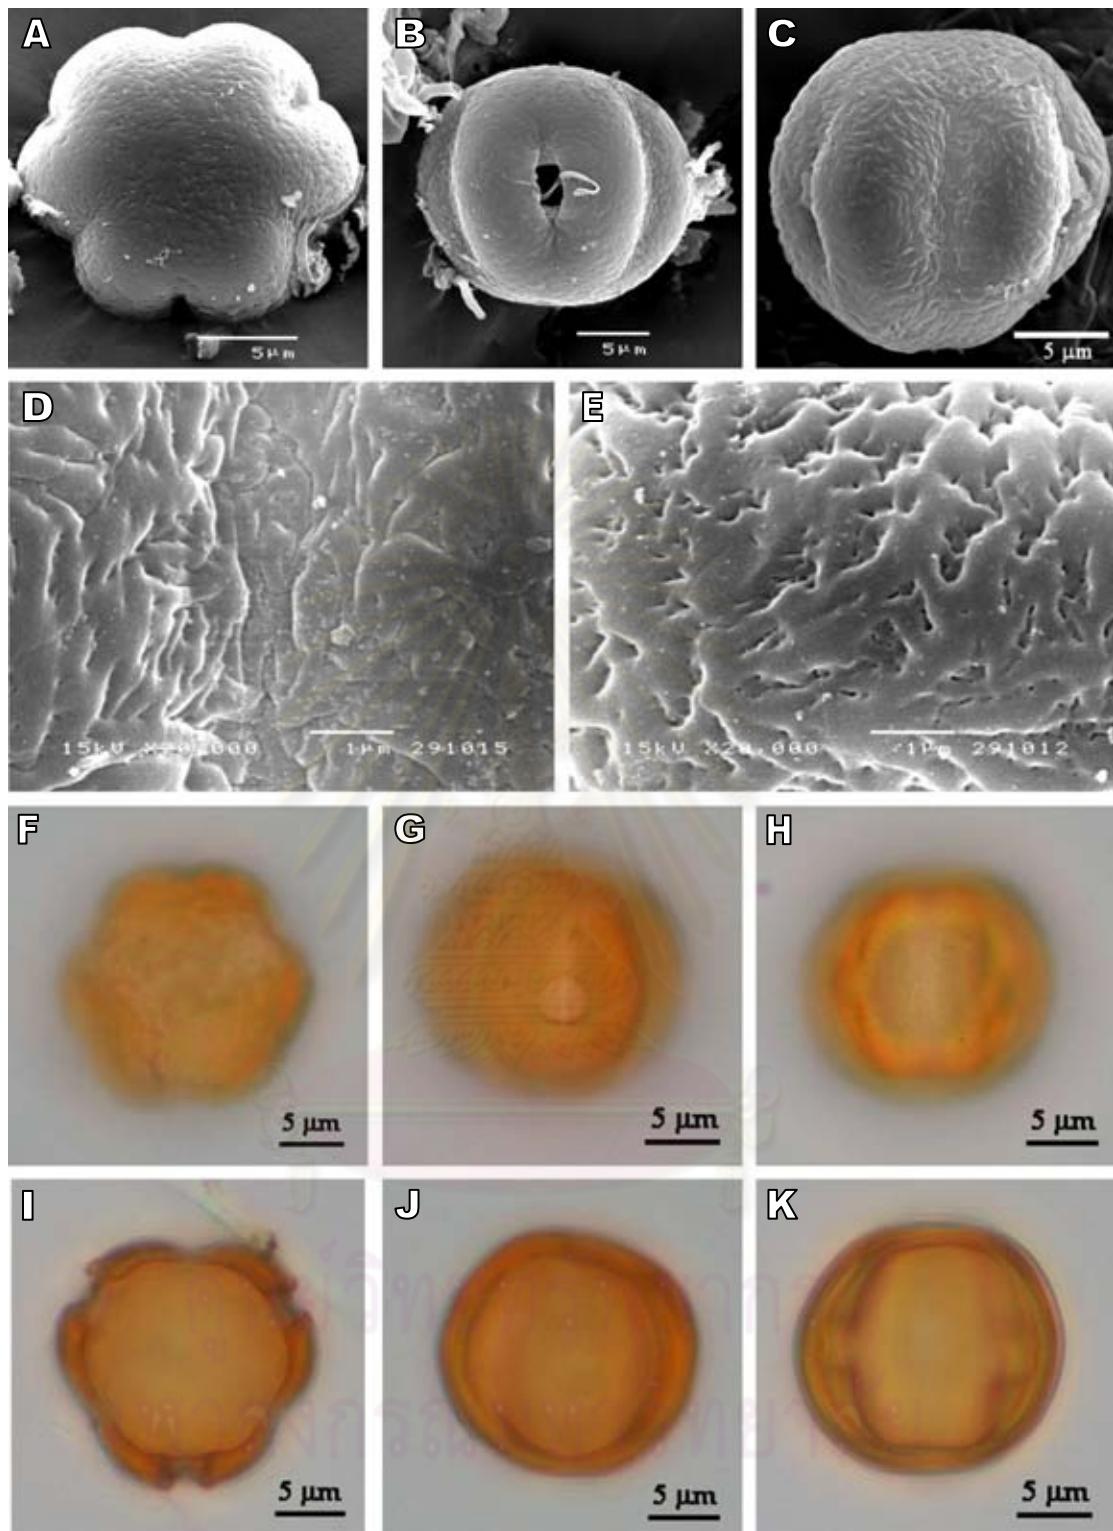

Plate 19 *Calycopteris floribunda* (Roxb.) Lam. ex Poir.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, pseudocolpus, (D) Equatorial view, pseudocolpus surface, (E) Surface between true and pseudoaperture, (F) Polar view, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, pseudocolpus surface, (I) Polar view, optical section, (J) Optical section under colporus, (K) Optical section under pseudocolpus (A-E: SEM; F-K: LM).

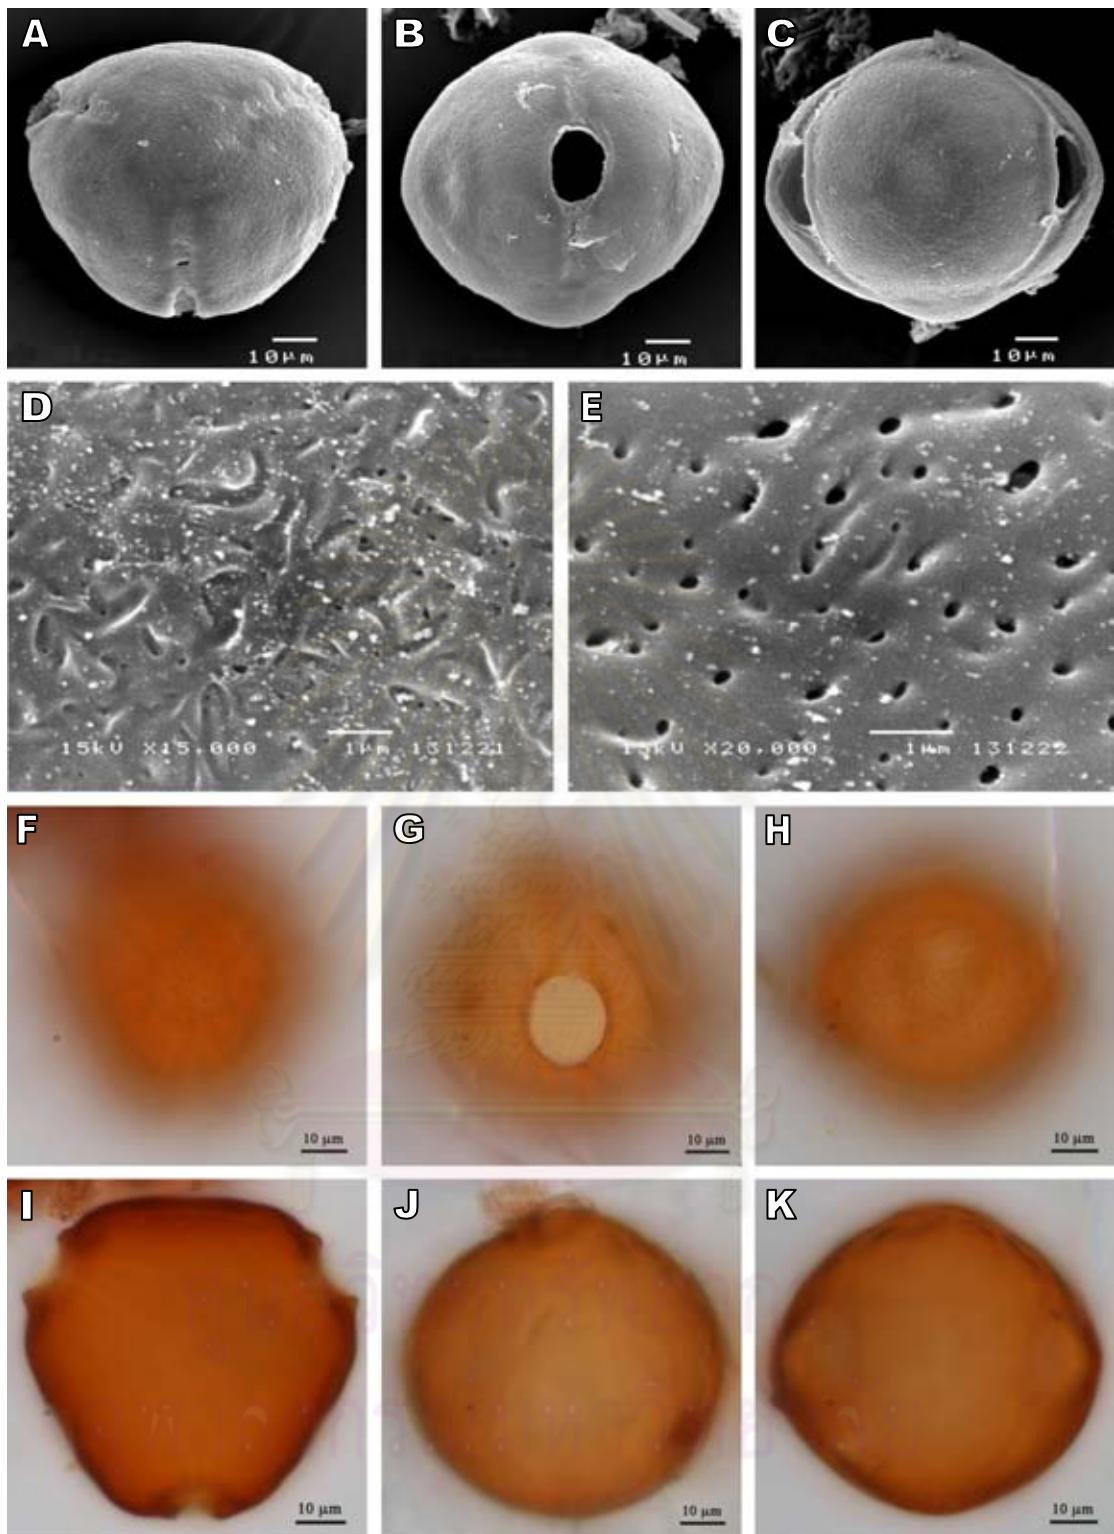

Plate 20 *Cerbera manghas* L.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, mesocolpium surface, (E) Polar view, surface, (F) Polar view, (G) Equatorial view, endoaperture, (H) Equatorial view, mesocolpium surface, (I) Polar view, optical section, (J) Optical section under colporus, (K) Optical section under mesocolpium (A-E: SEM; F-K: LM).

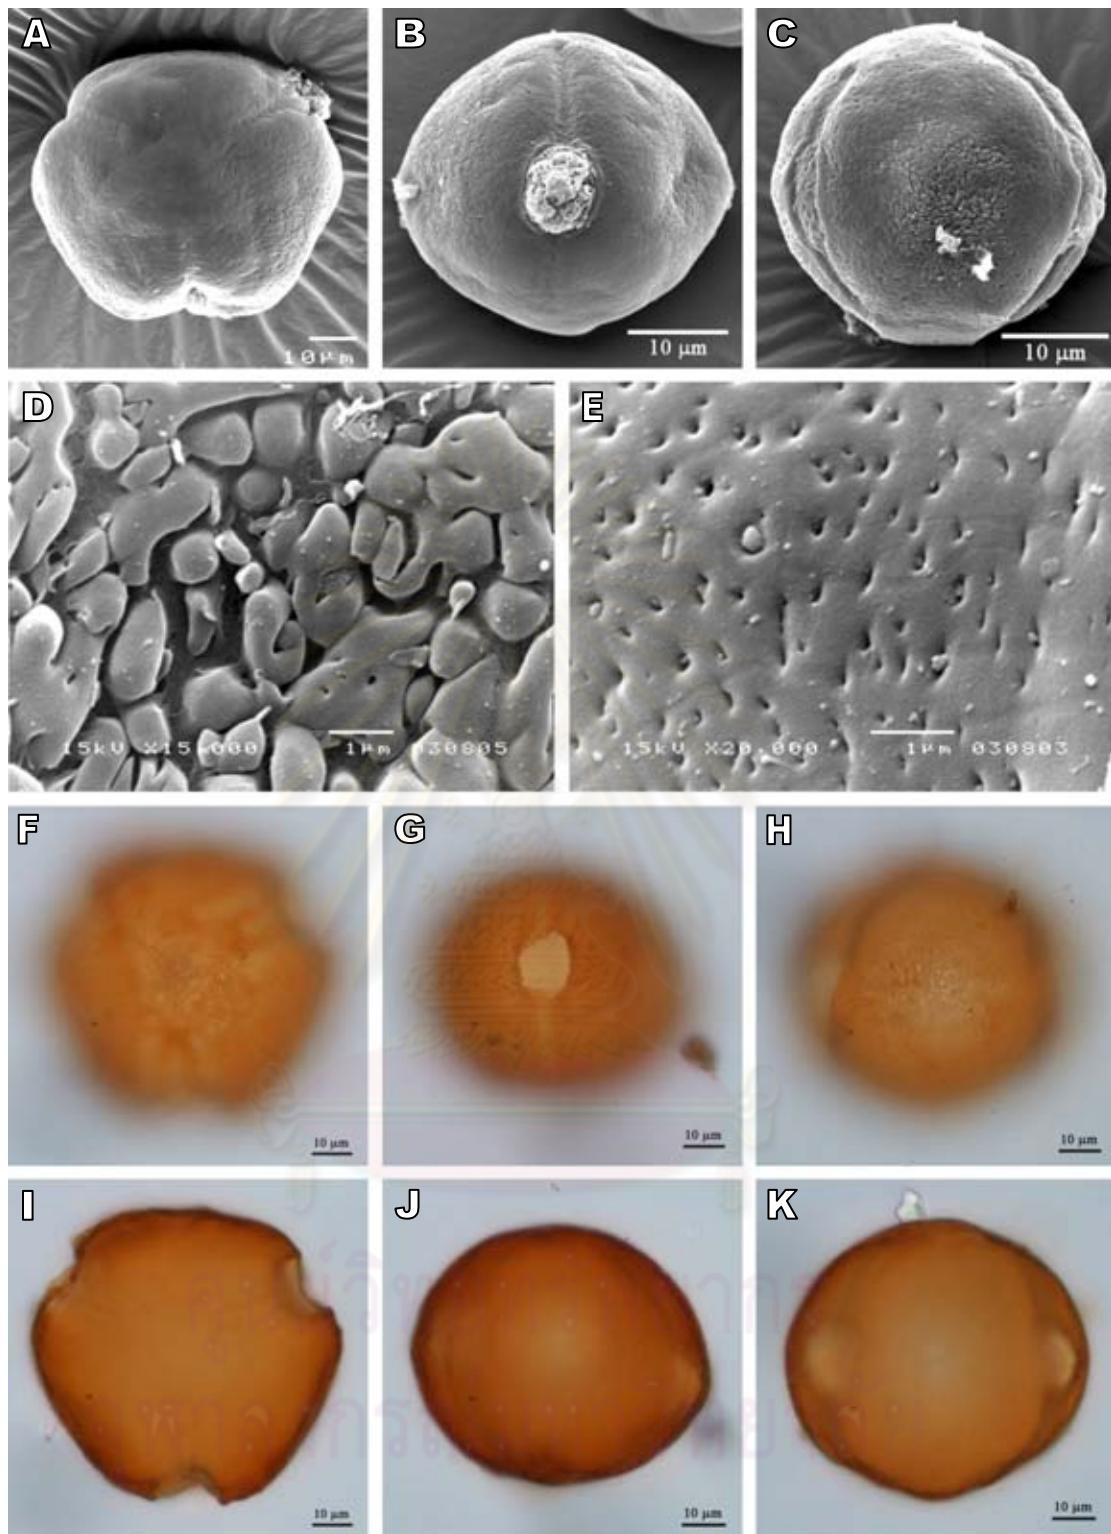

Plate 21 *Cerbera odollam* Gaertn.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, mesocolpium surface, (E) Polar view, surface, (F) Polar view, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, mesocolpium surface, (I) Polar view, optical section, (J) Optical section under colporus, (K) Optical section under mesocolpium (A-E: SEM; F-K: LM).

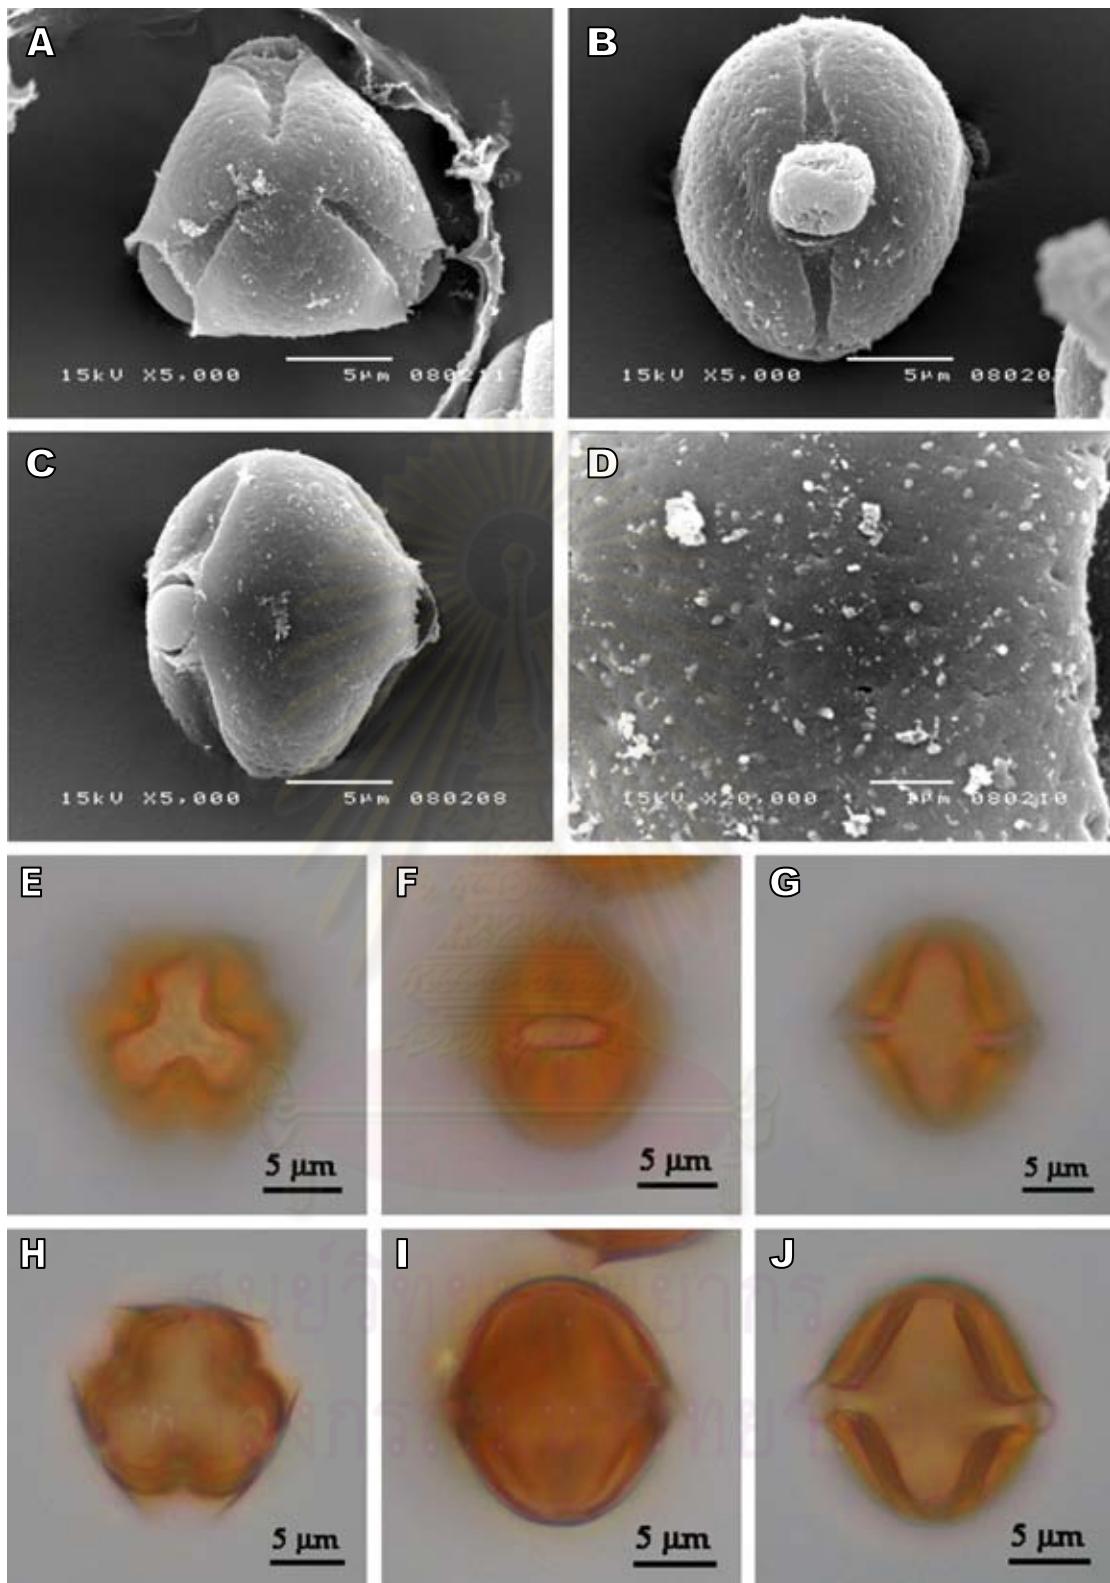

Plate 22 *Aegiceras corniculatum* (L.) Blanco: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

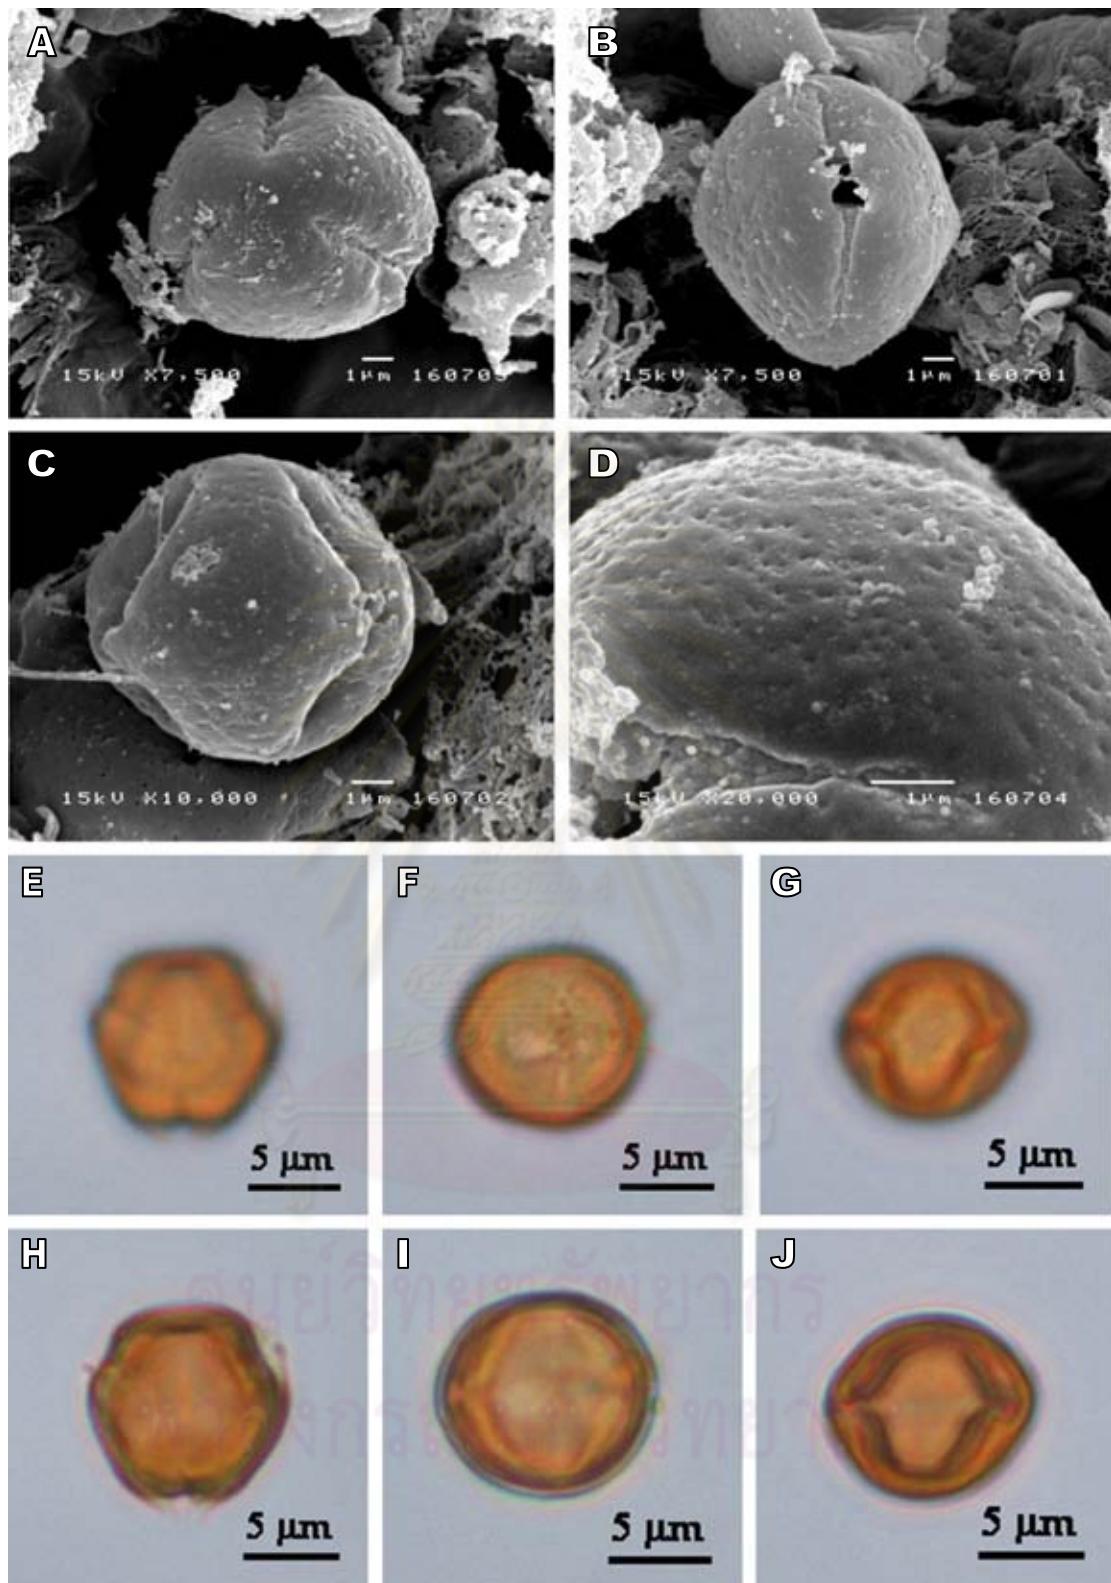

Plate 23 *Bruguiera cylindrica* (L.) Blume: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

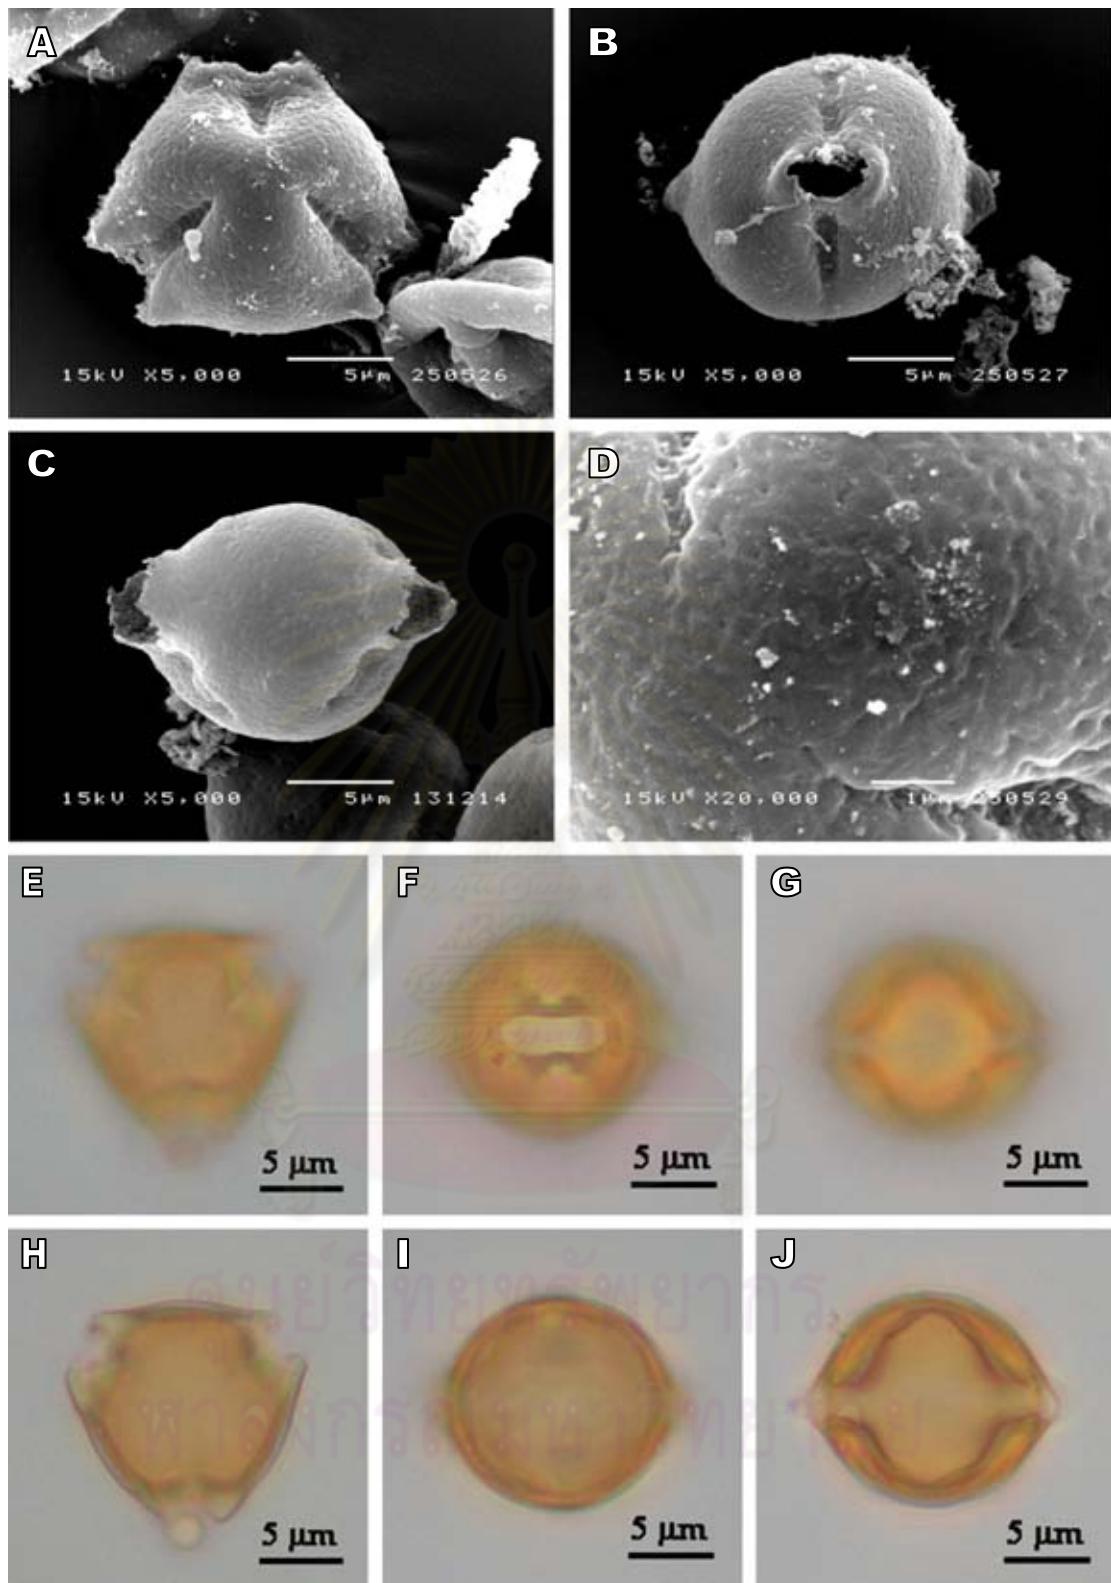

Plate 24 *Bruguiera gymnorhiza* (L.) Savigny: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Oblique polar view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

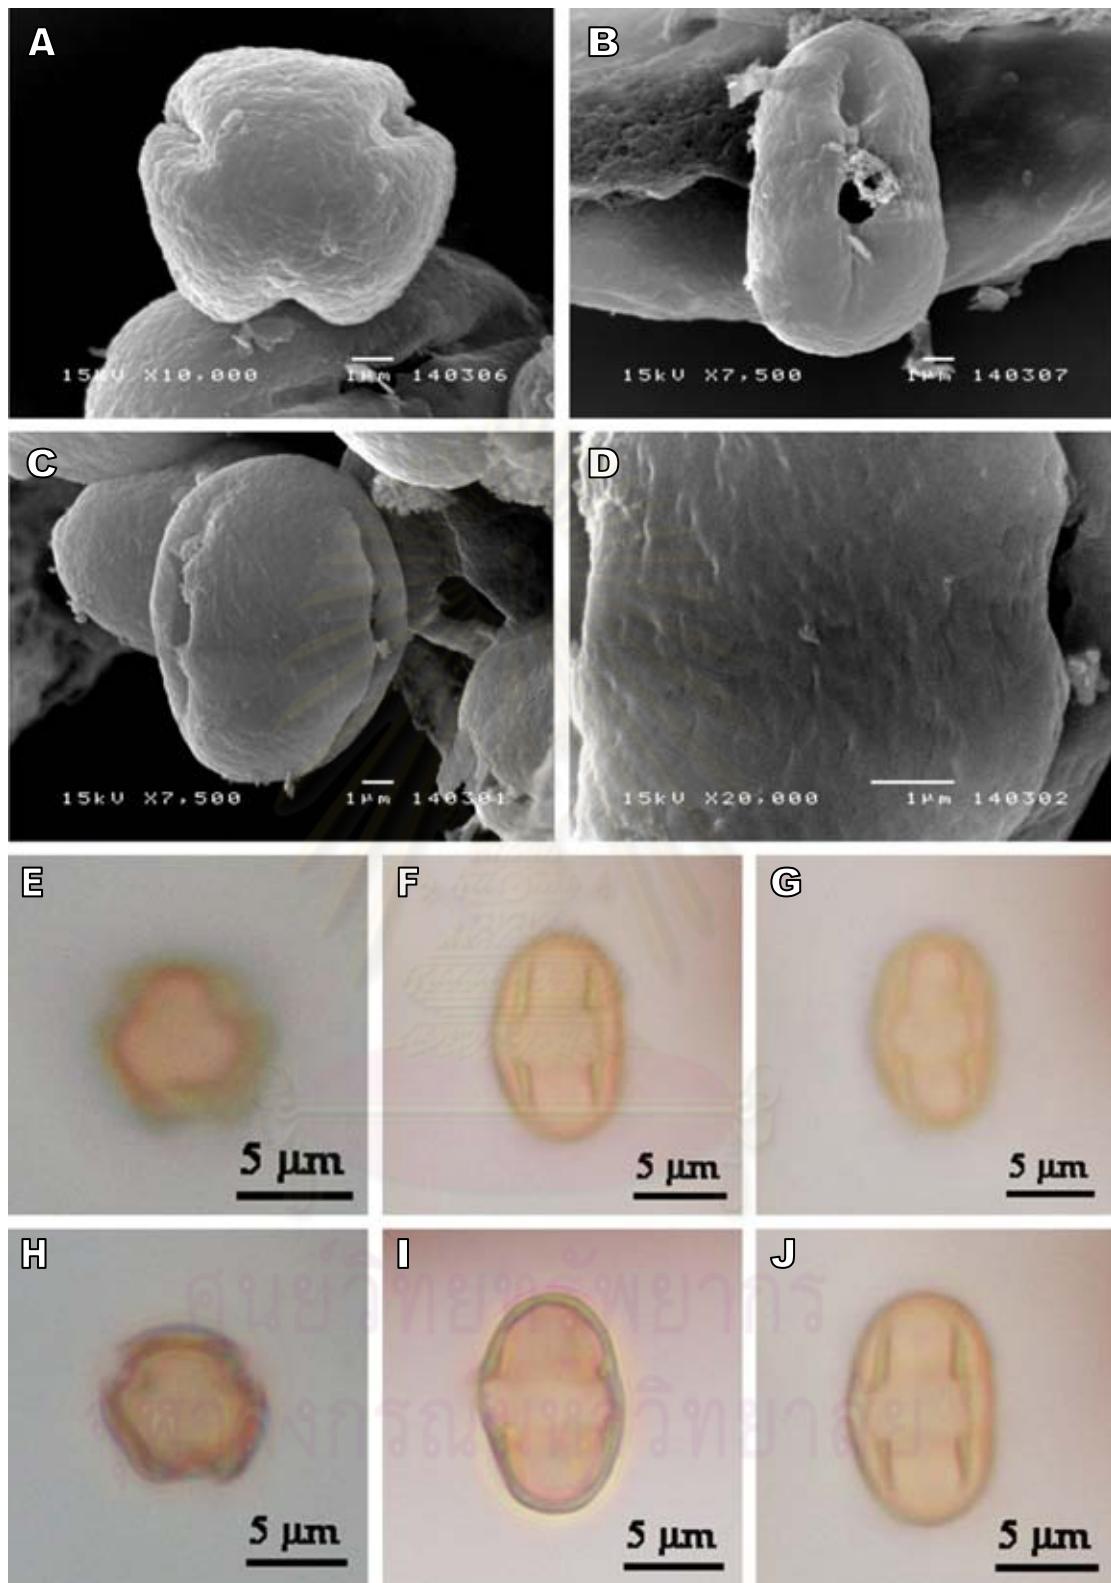

Plate 25 *Bruguiera parviflora* (Roxb.) Wight & Arn. ex Griff.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endocingulum, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

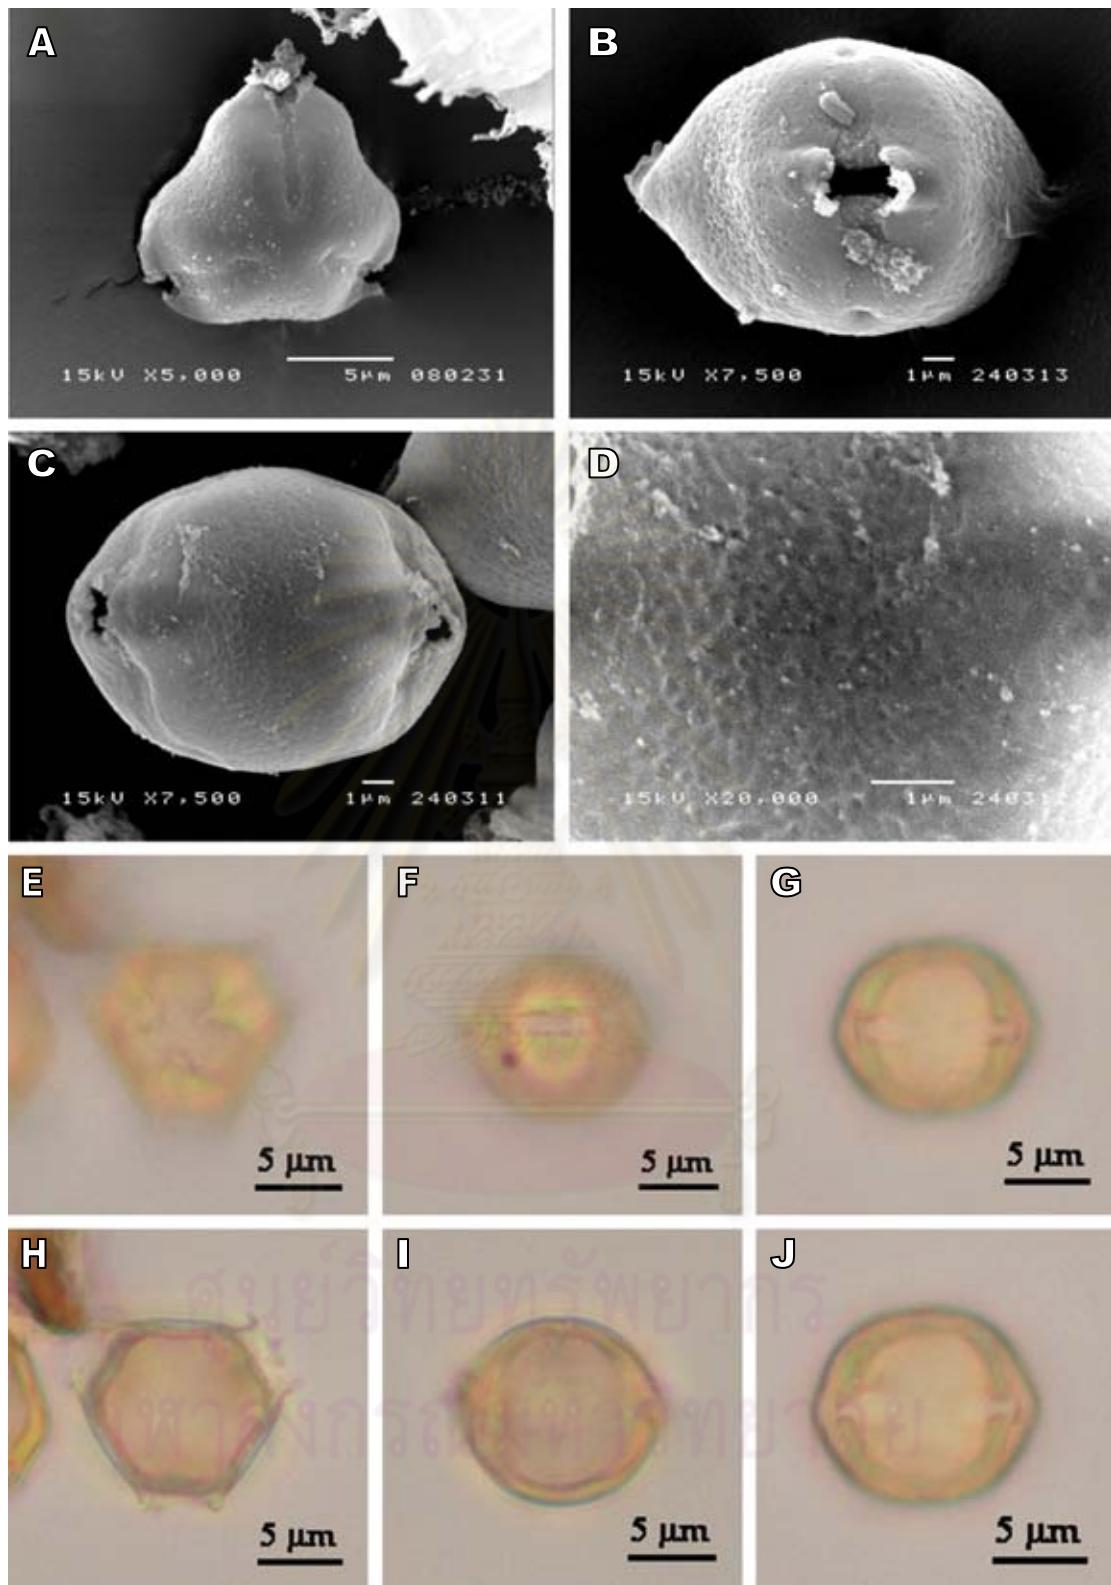

Plate 26 *Bruguiera sexangula* (Lour.): (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

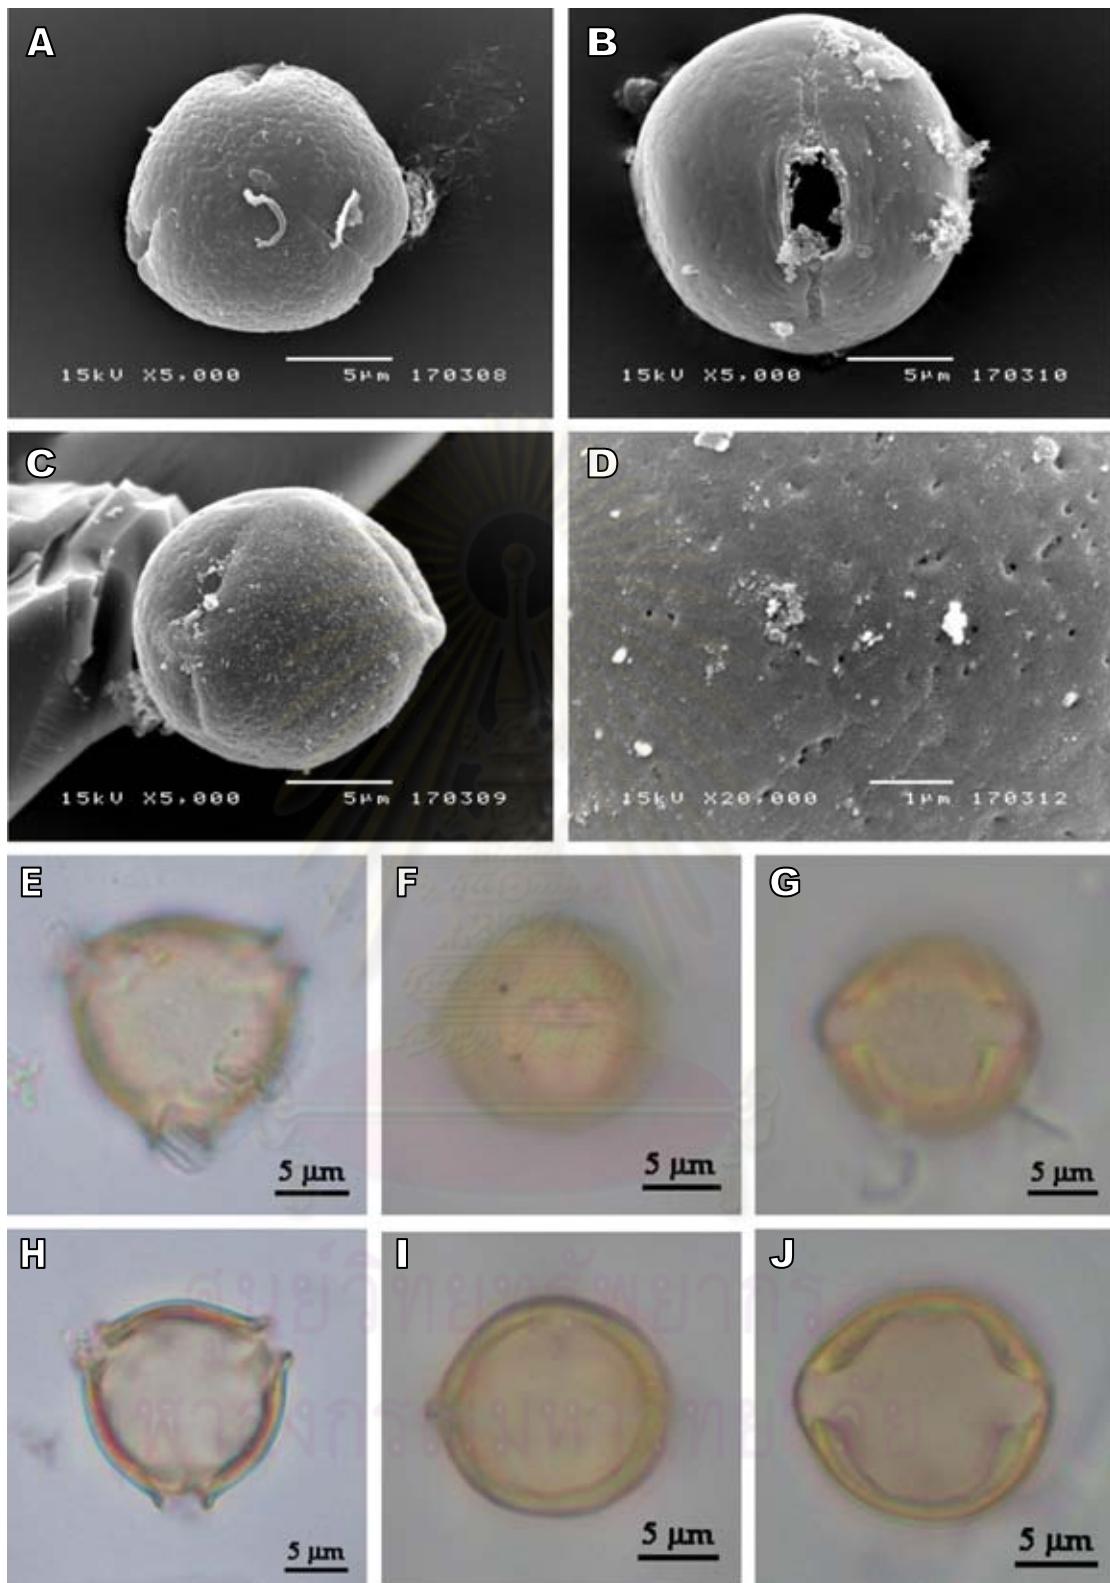

Plate 27 *Ceriops decandra* (Griff.) W. Theob.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

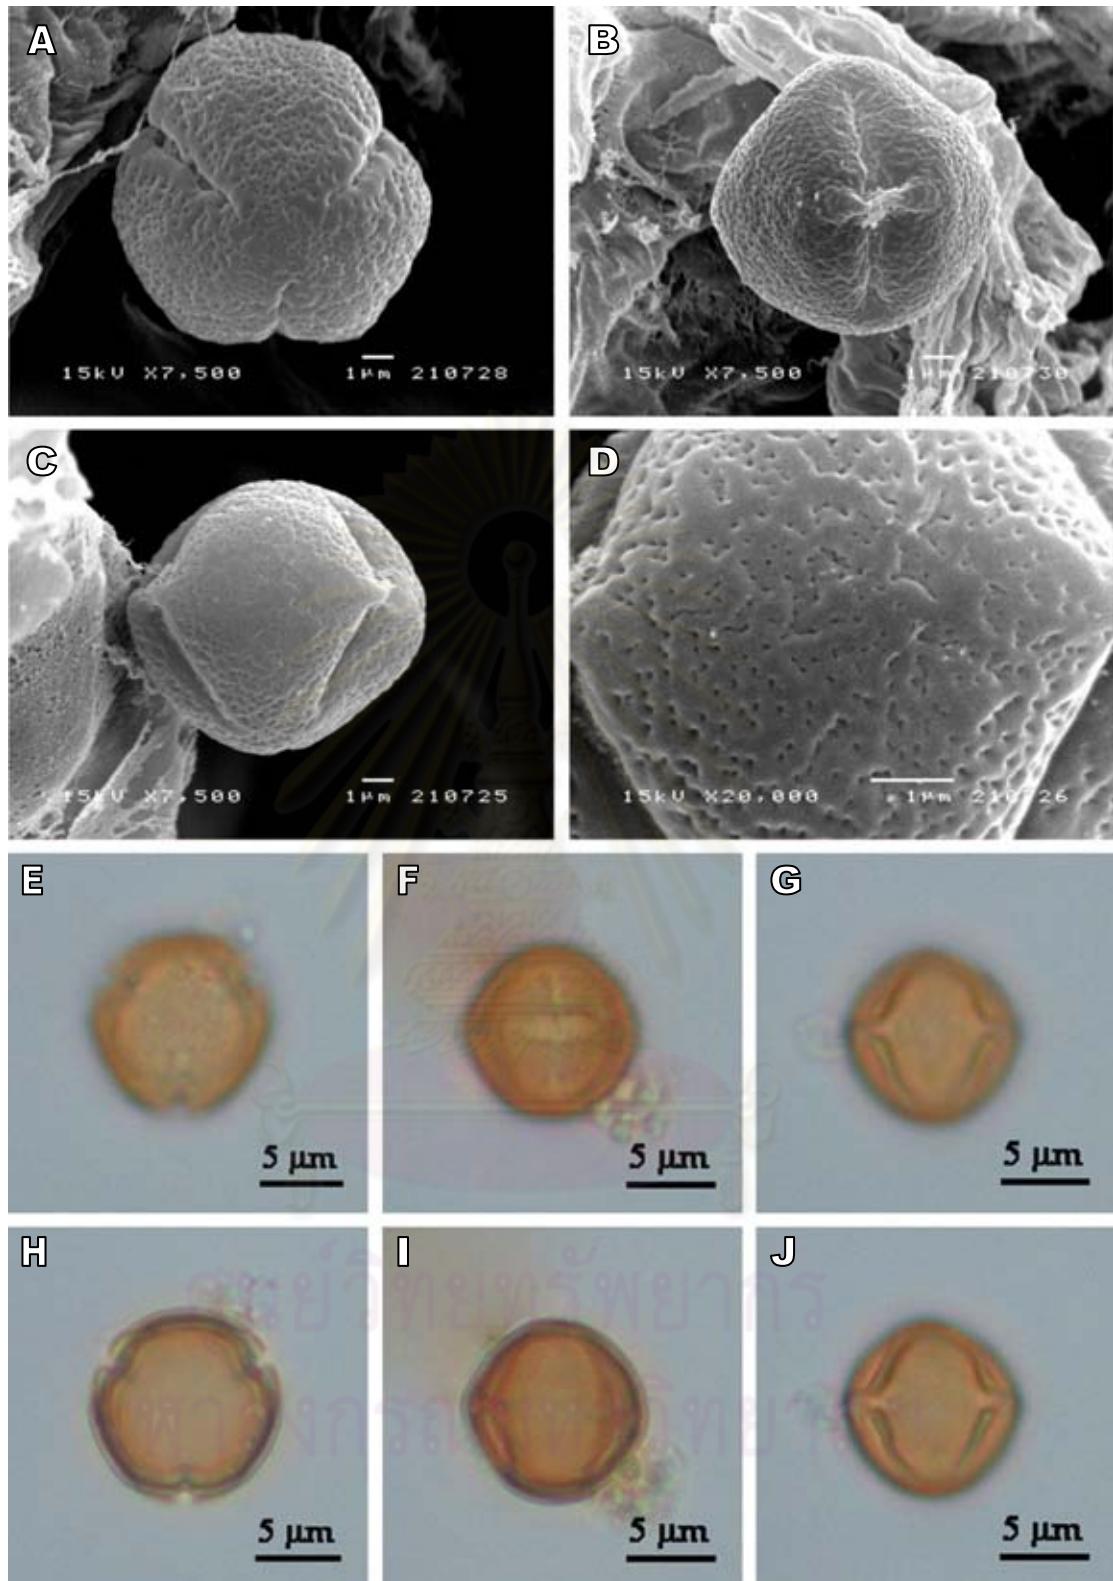

Plate 28 *Ceriops tagal* (Perr.) C.B. Rob.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

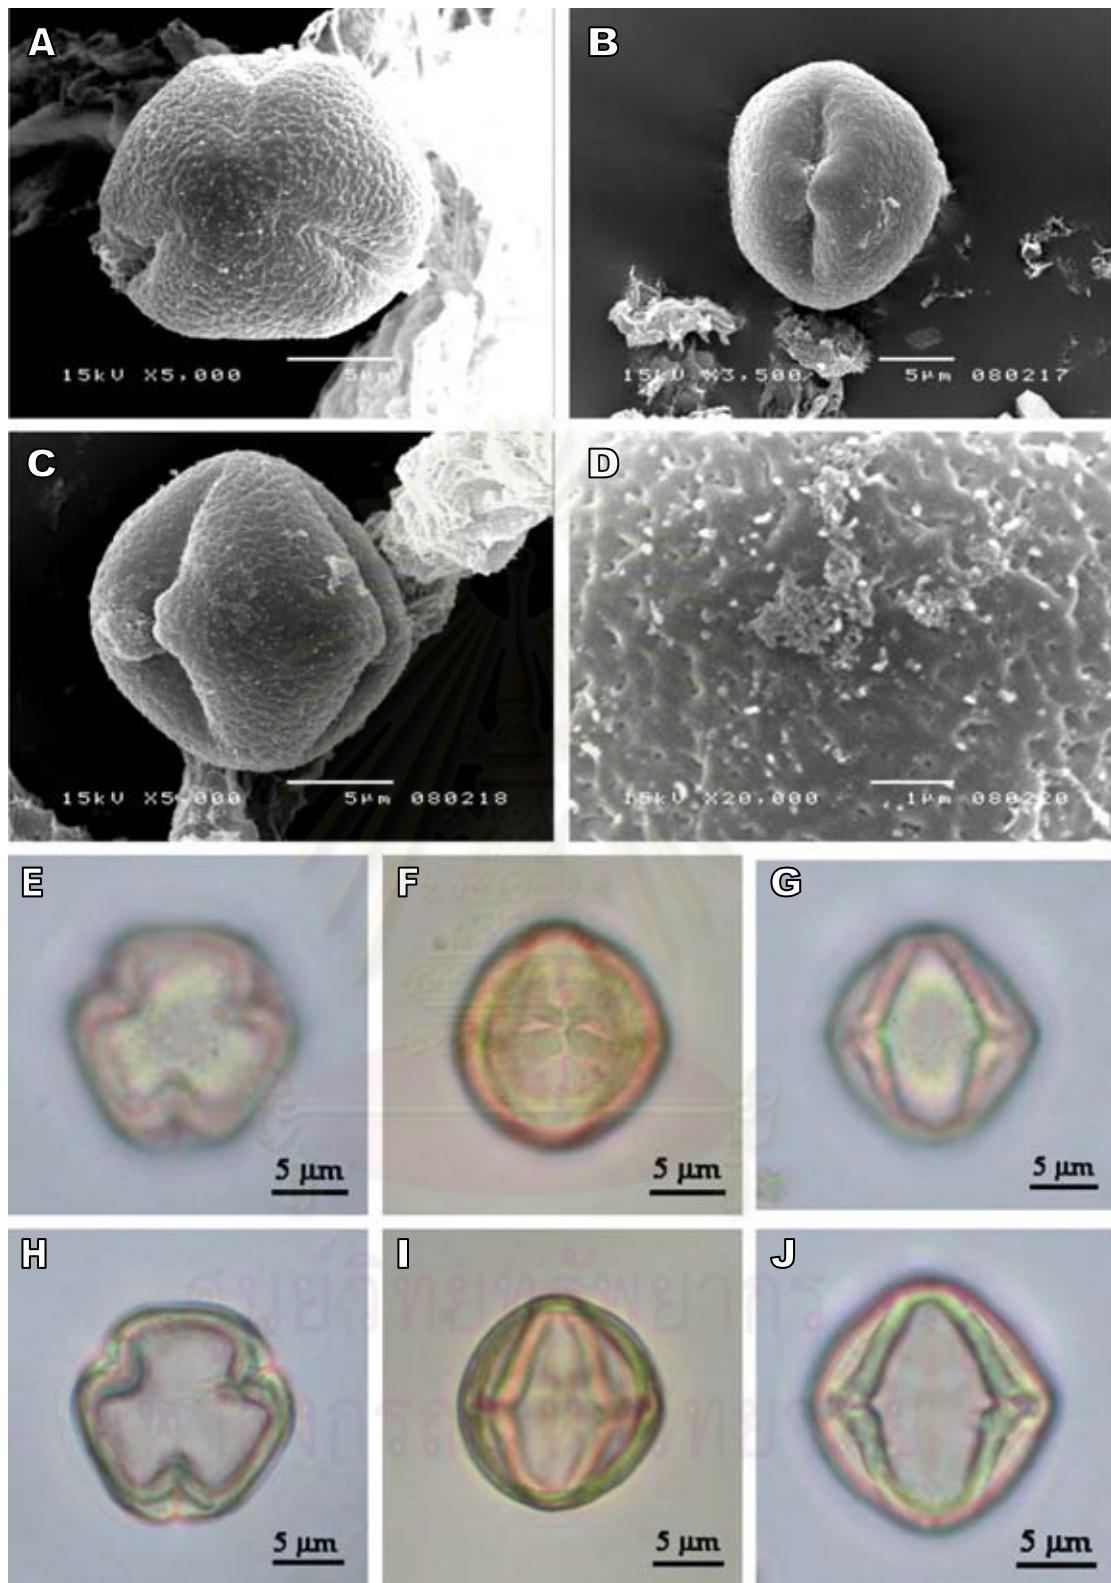

Plate 29 *Kandelia candel* (L.) Druce: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

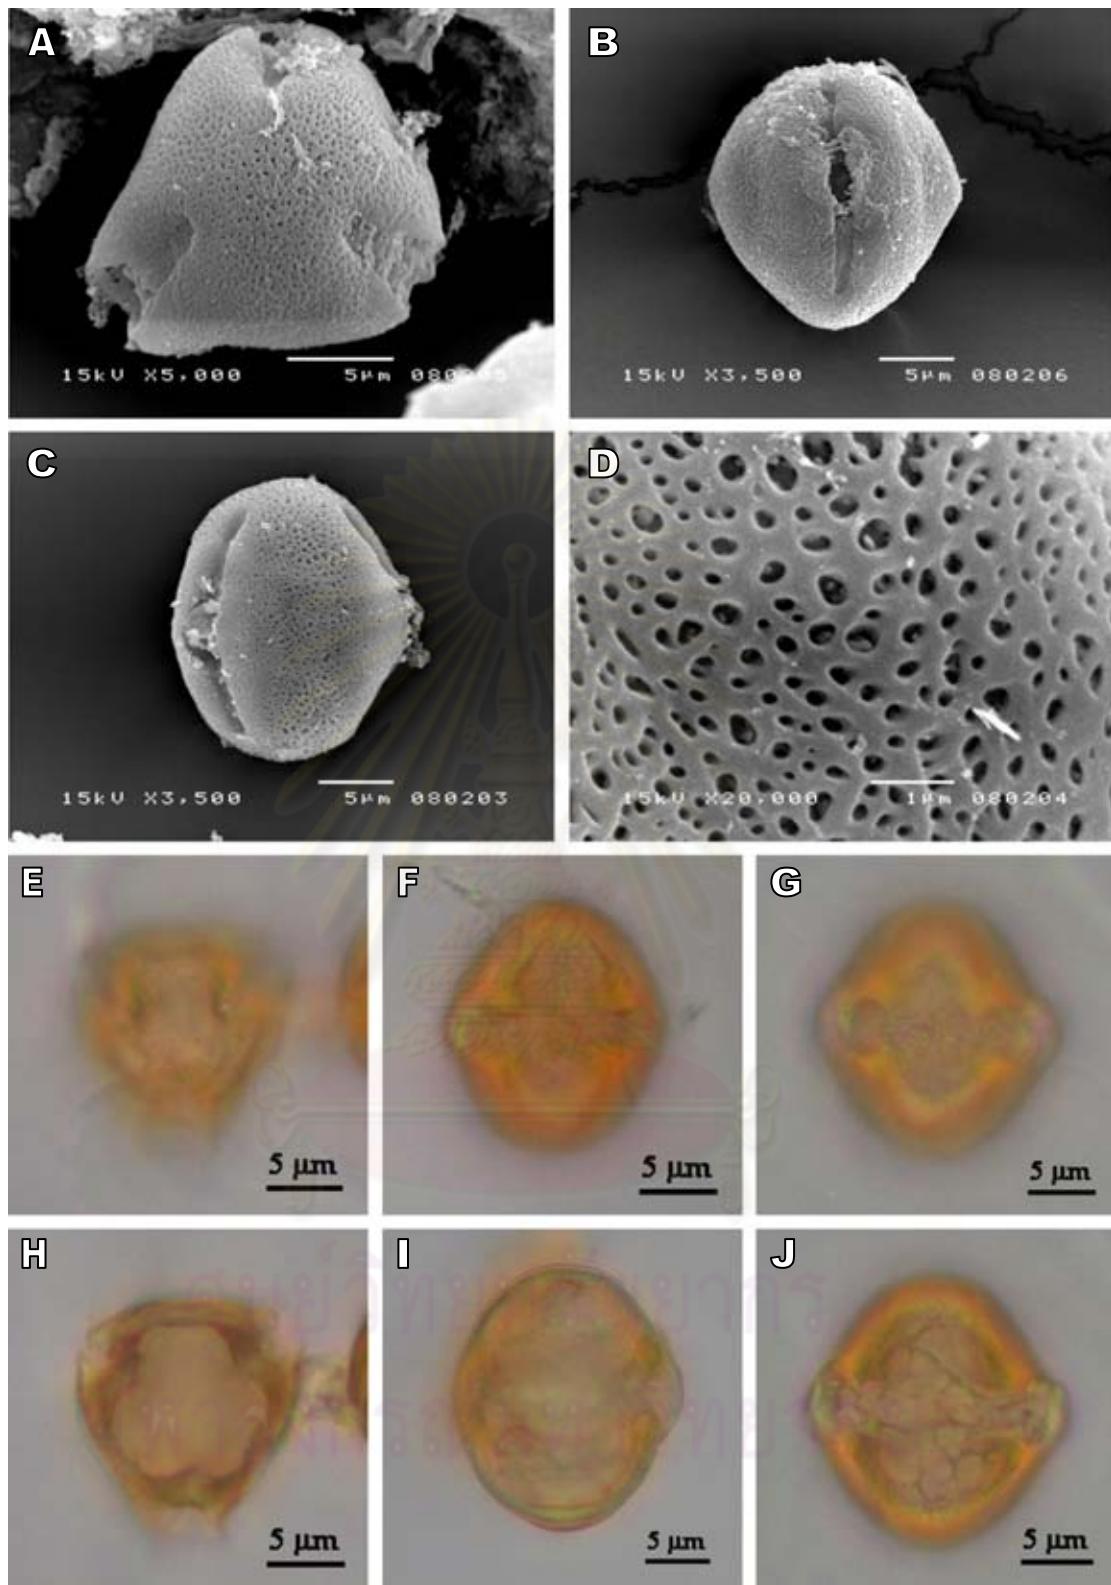

Plate 30 *Rhizophora apiculata* Blume: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endocingulum, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

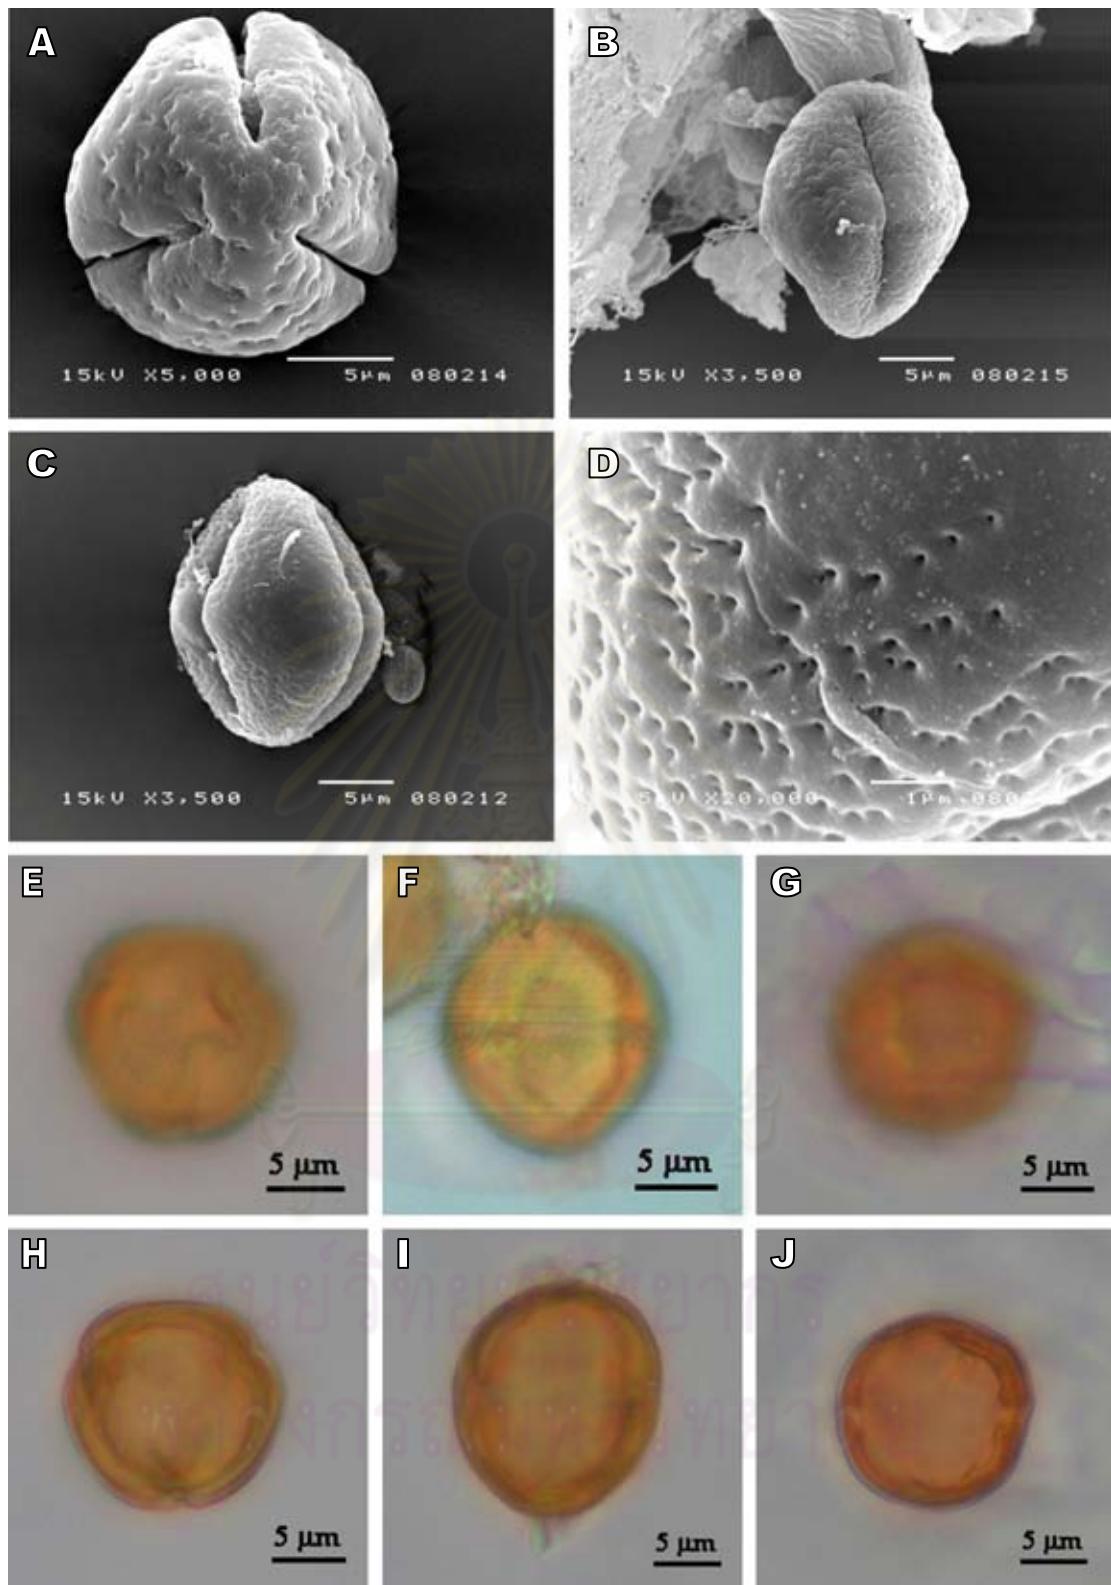

Plate 31 *Rhizophora mucronata* Lam.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endocingulum, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

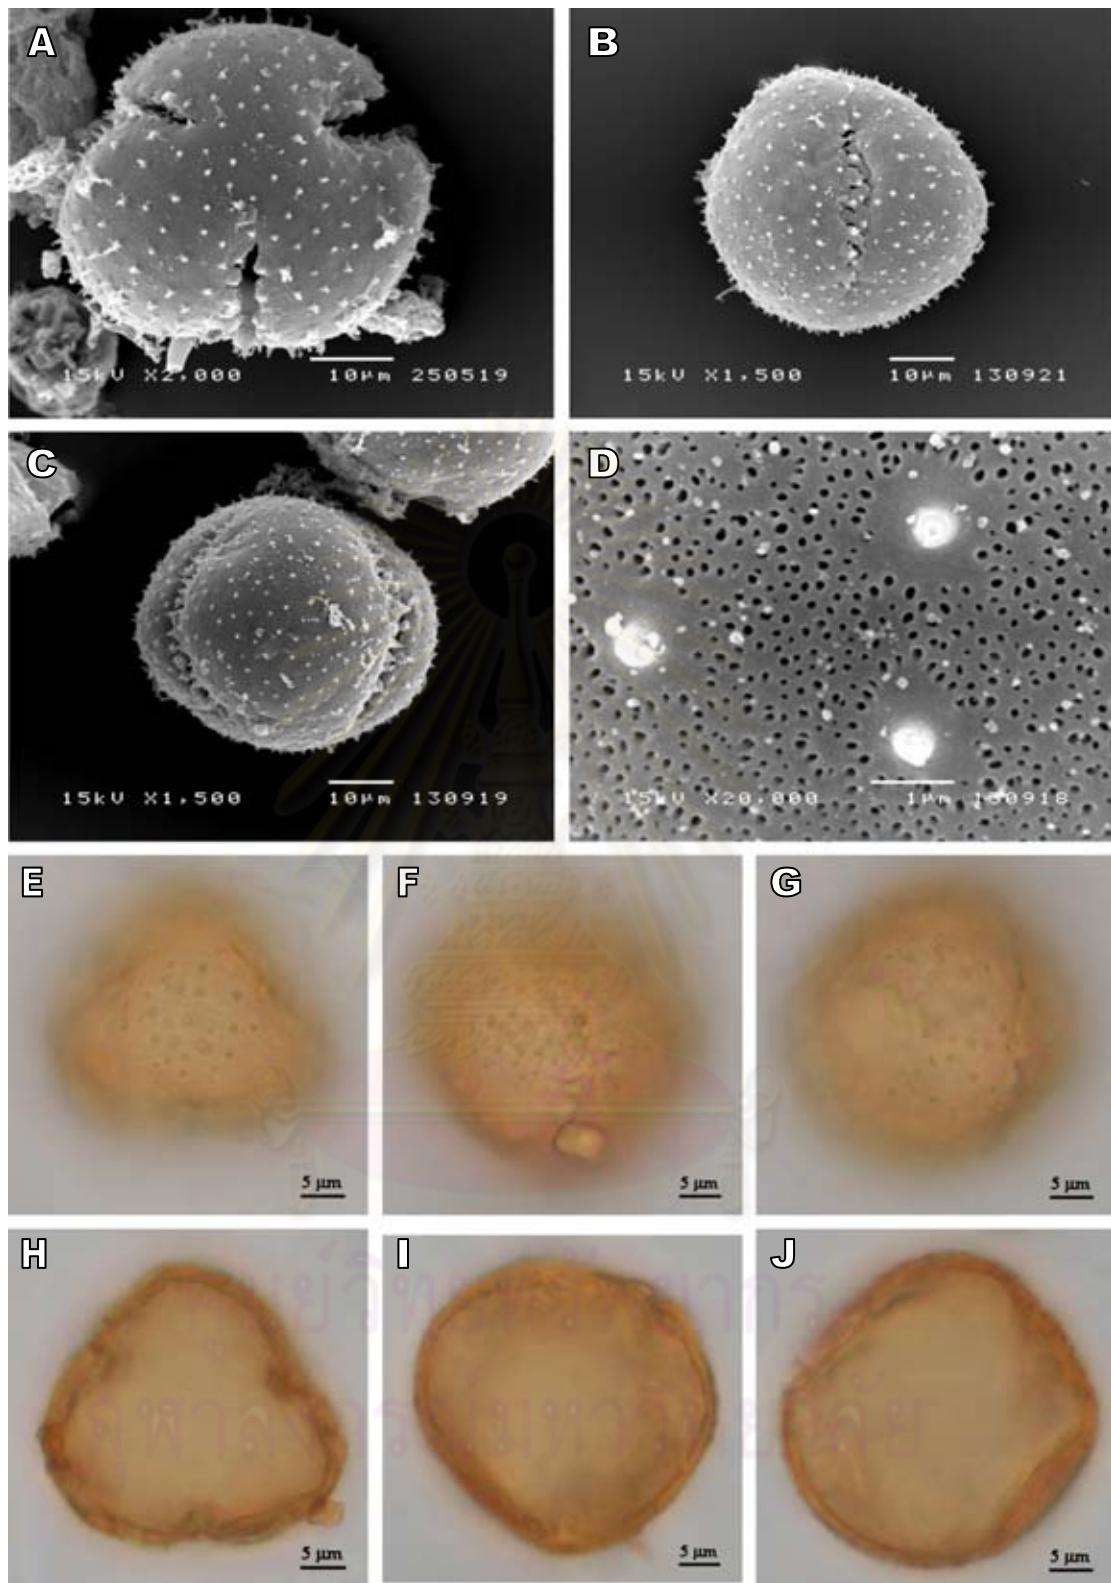

Plate 32 *Clerodendrum inerme* (L.) Gaertn.: (A) Polar view, (B) Equatorial view, colpus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, colpus, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colpus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

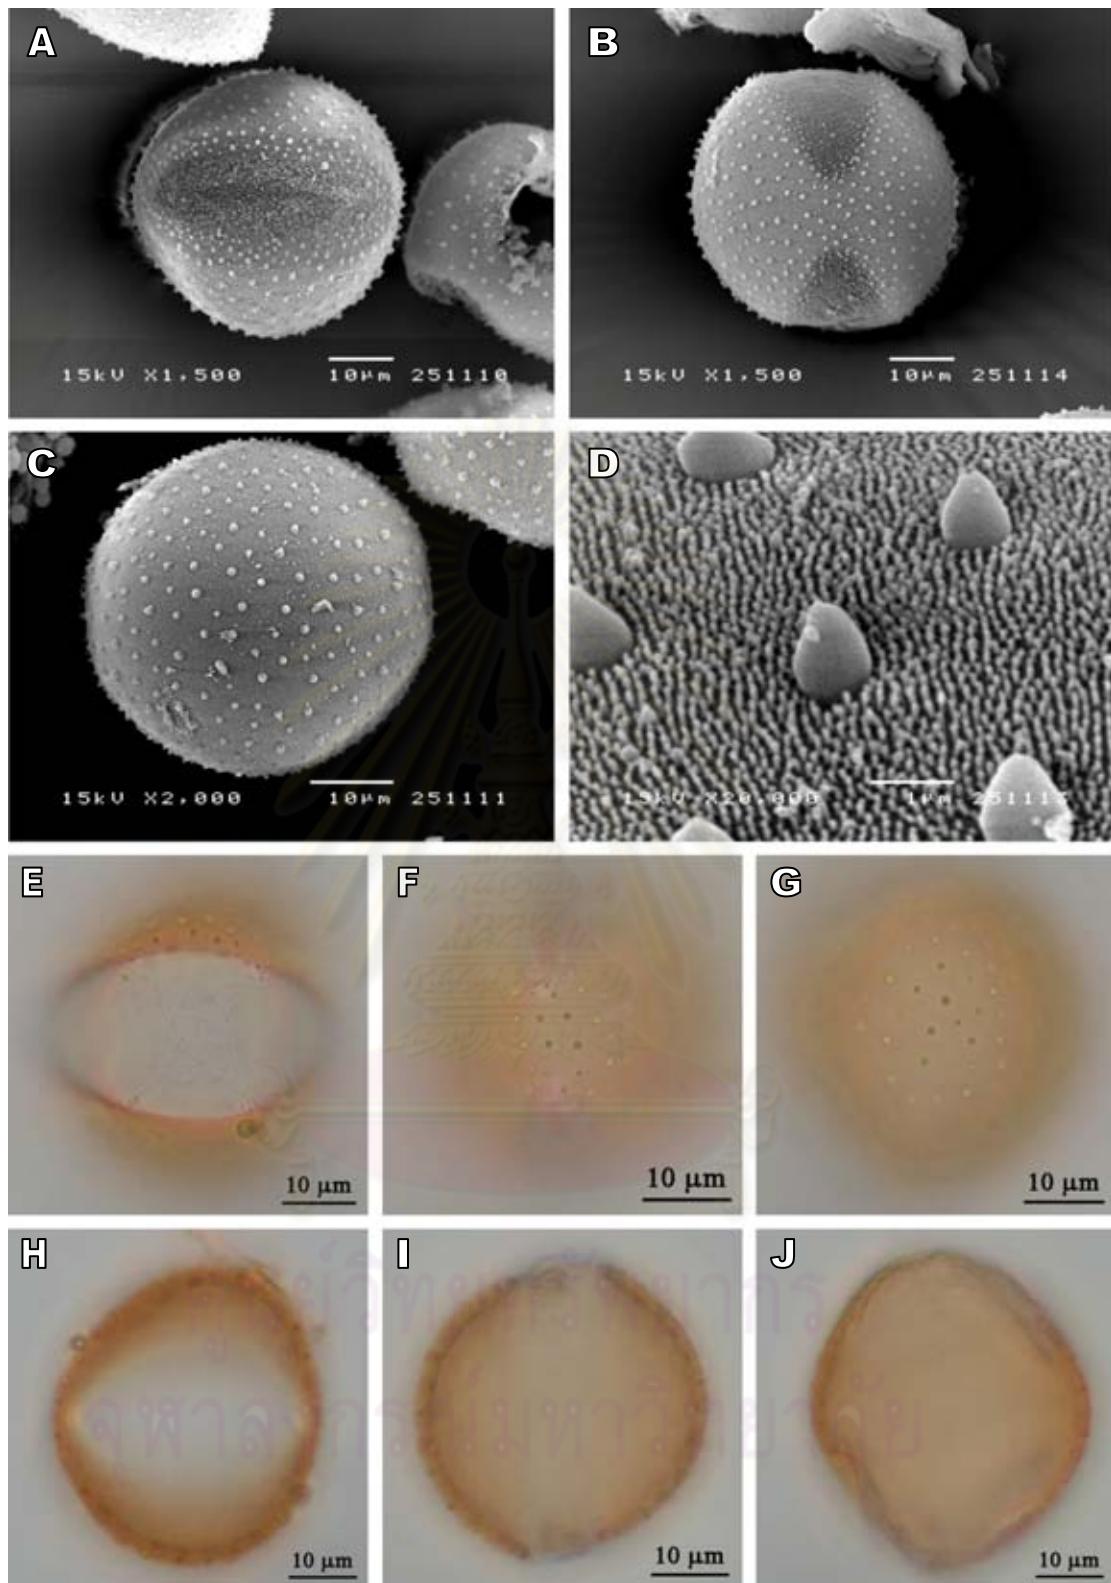

Plate 33 *Crinum asiaticum* L.: (A) Polar view, (B) Shorter equatorial view, (C) Longer equatorial view, (D) Equatorial view, surface, (E) Polar view, colpus, (F) Shorter equatorial view, surface, (G) Longer equatorial view, surface, (H) Polar view, optical section, (I) Shorter equatorial view, optical section, (J) Longer equatorial view, optical section (A-D: SEM; E-J: LM).

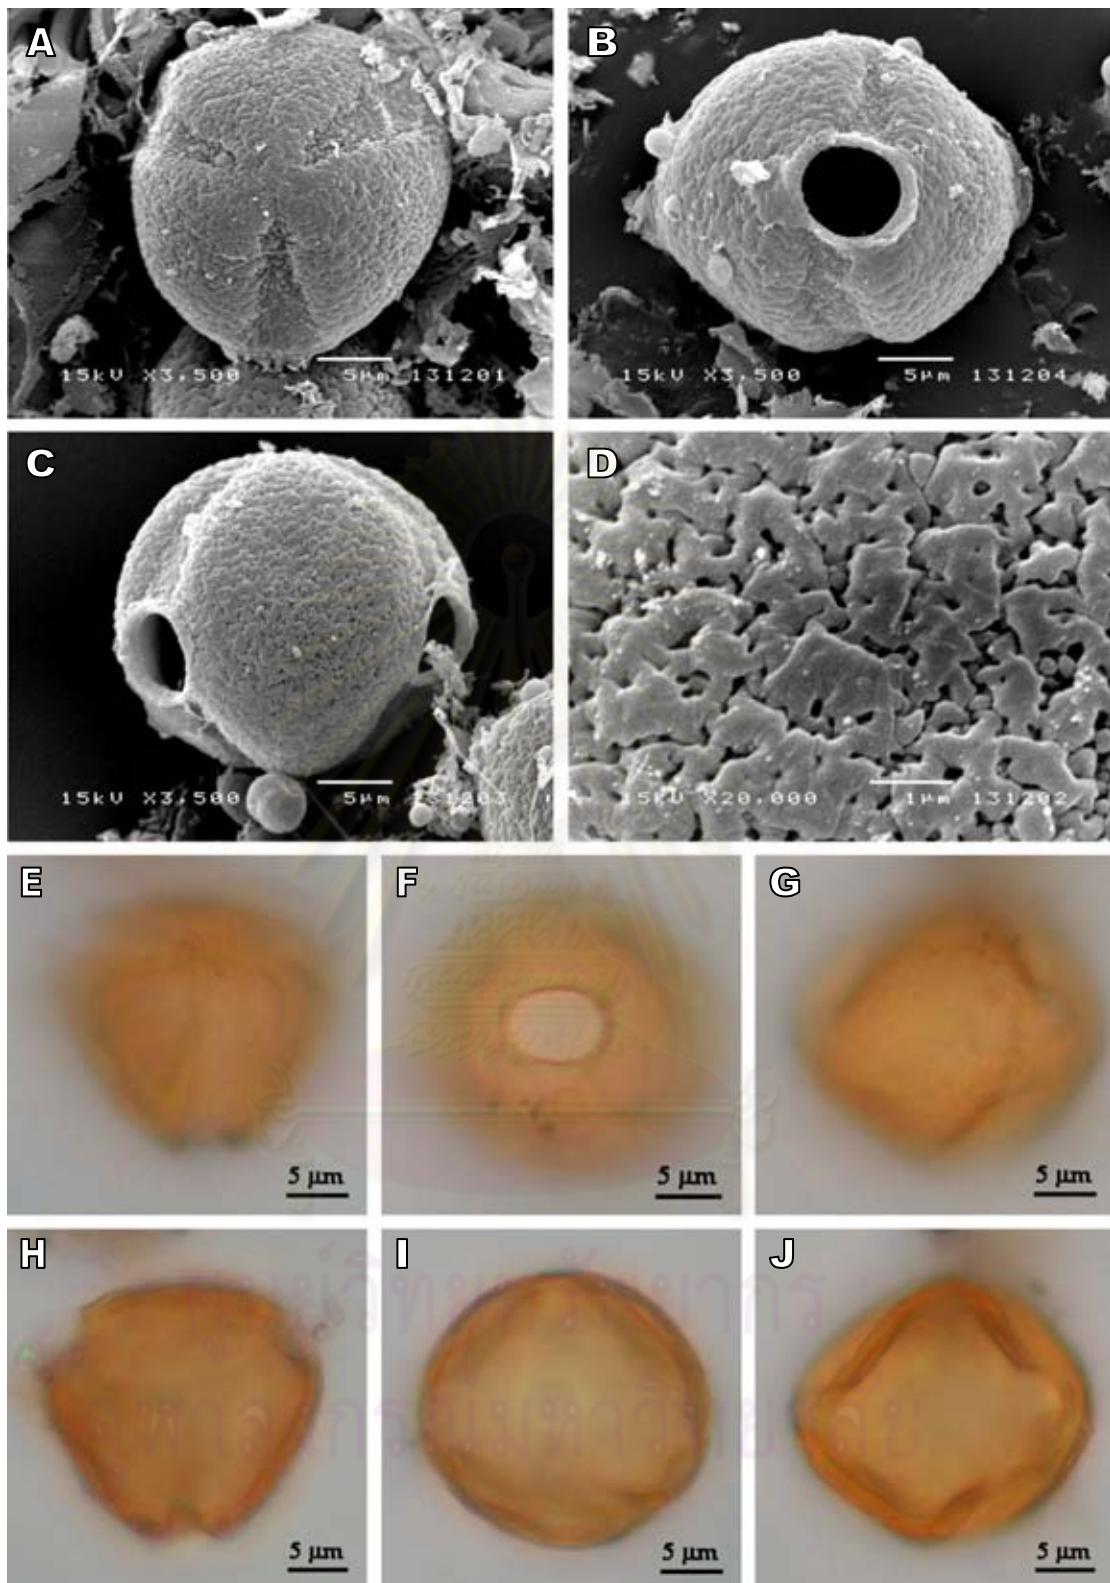

Plate 34 *Cynometra ramiflora* L.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

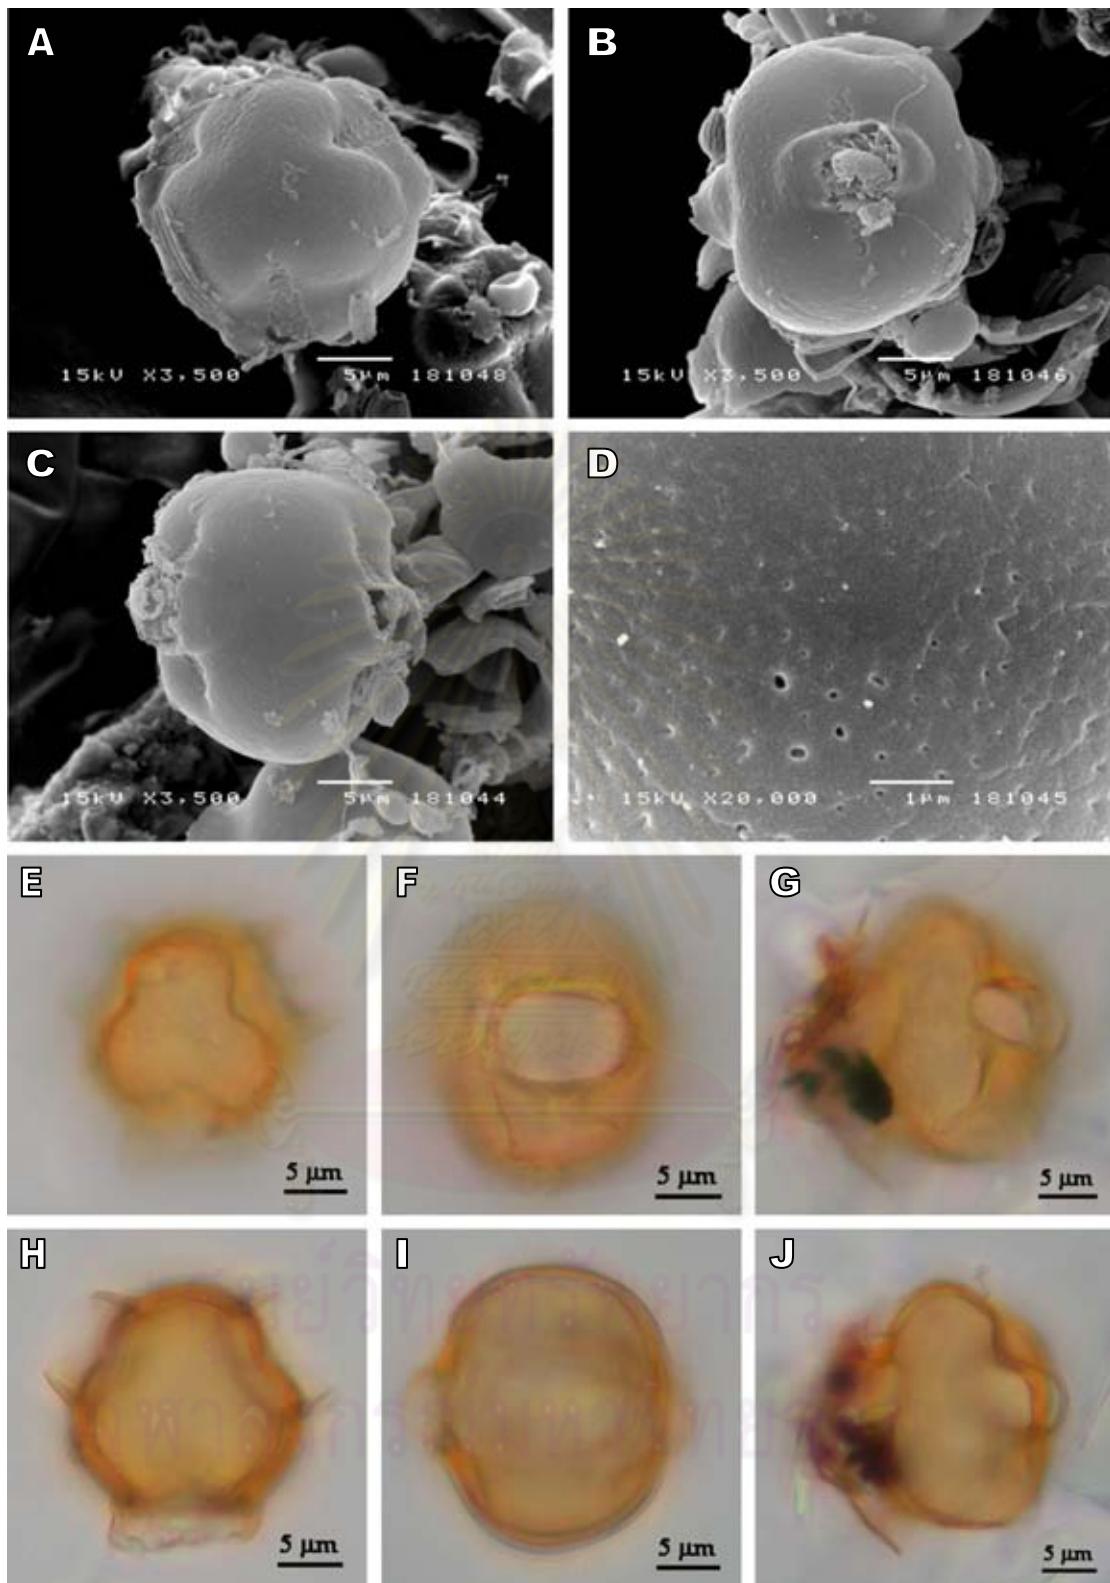

Plate 35 *Dalbergia candenatensis* (Dennst.) Prain: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

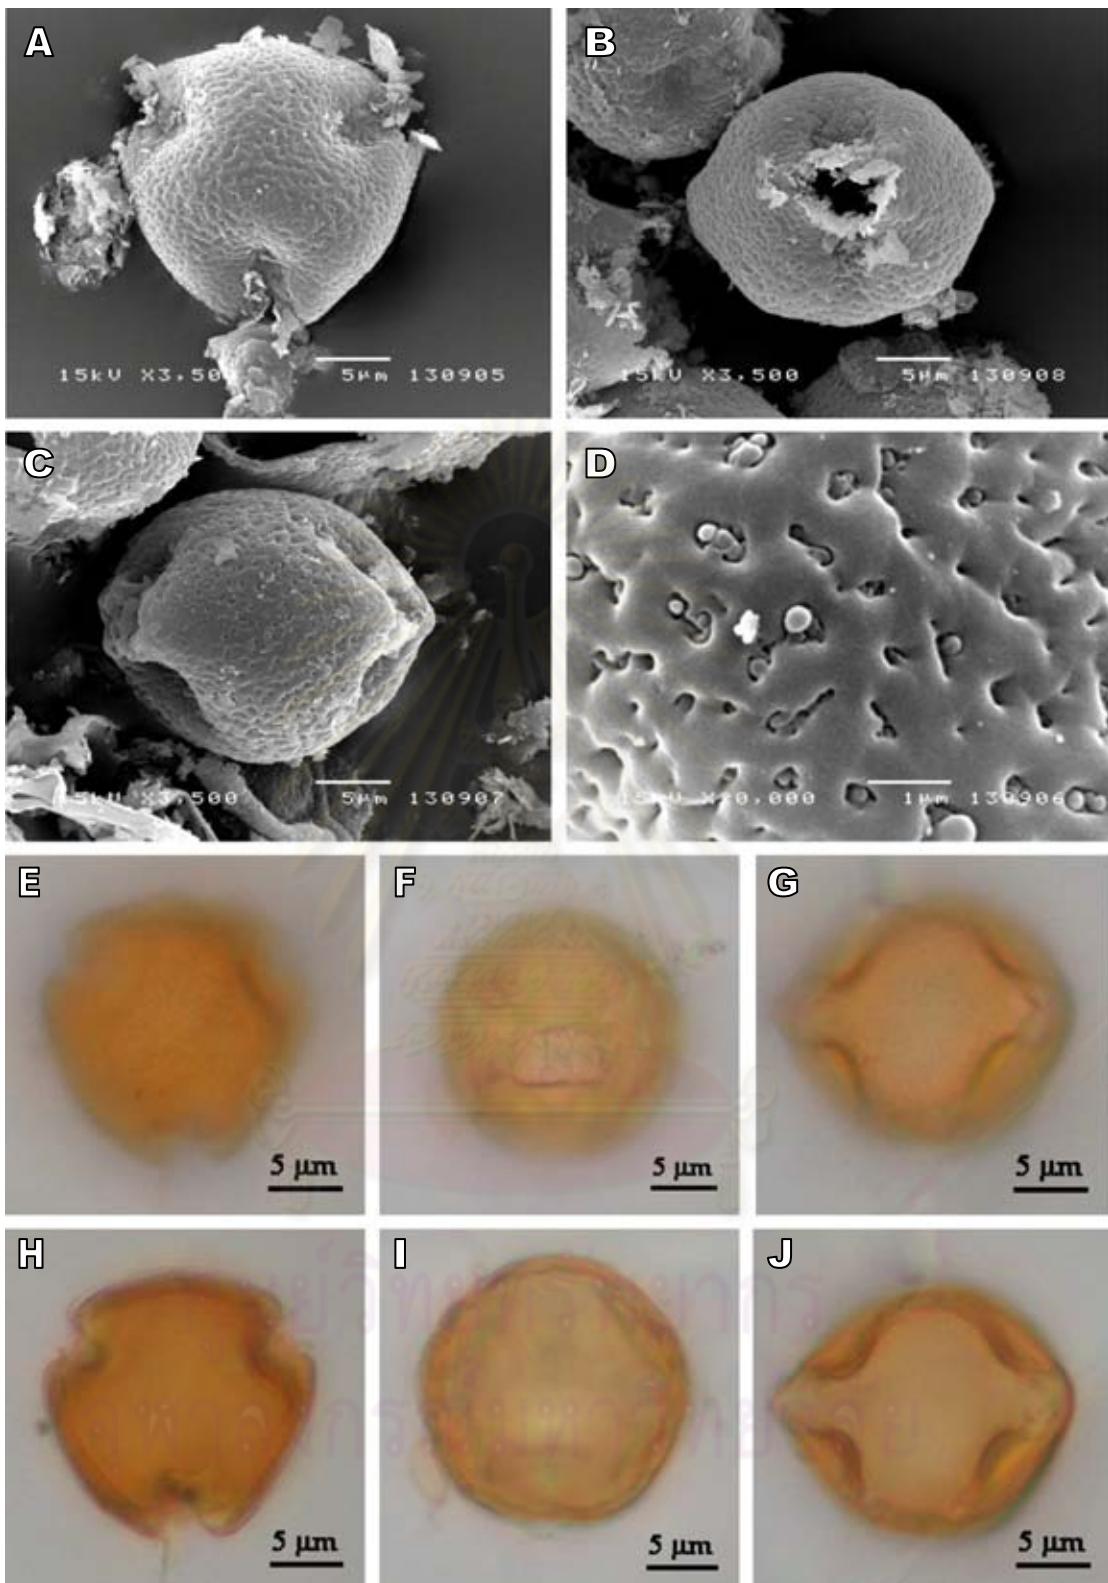

Plate 36 *Derris trifoliata* Lour.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

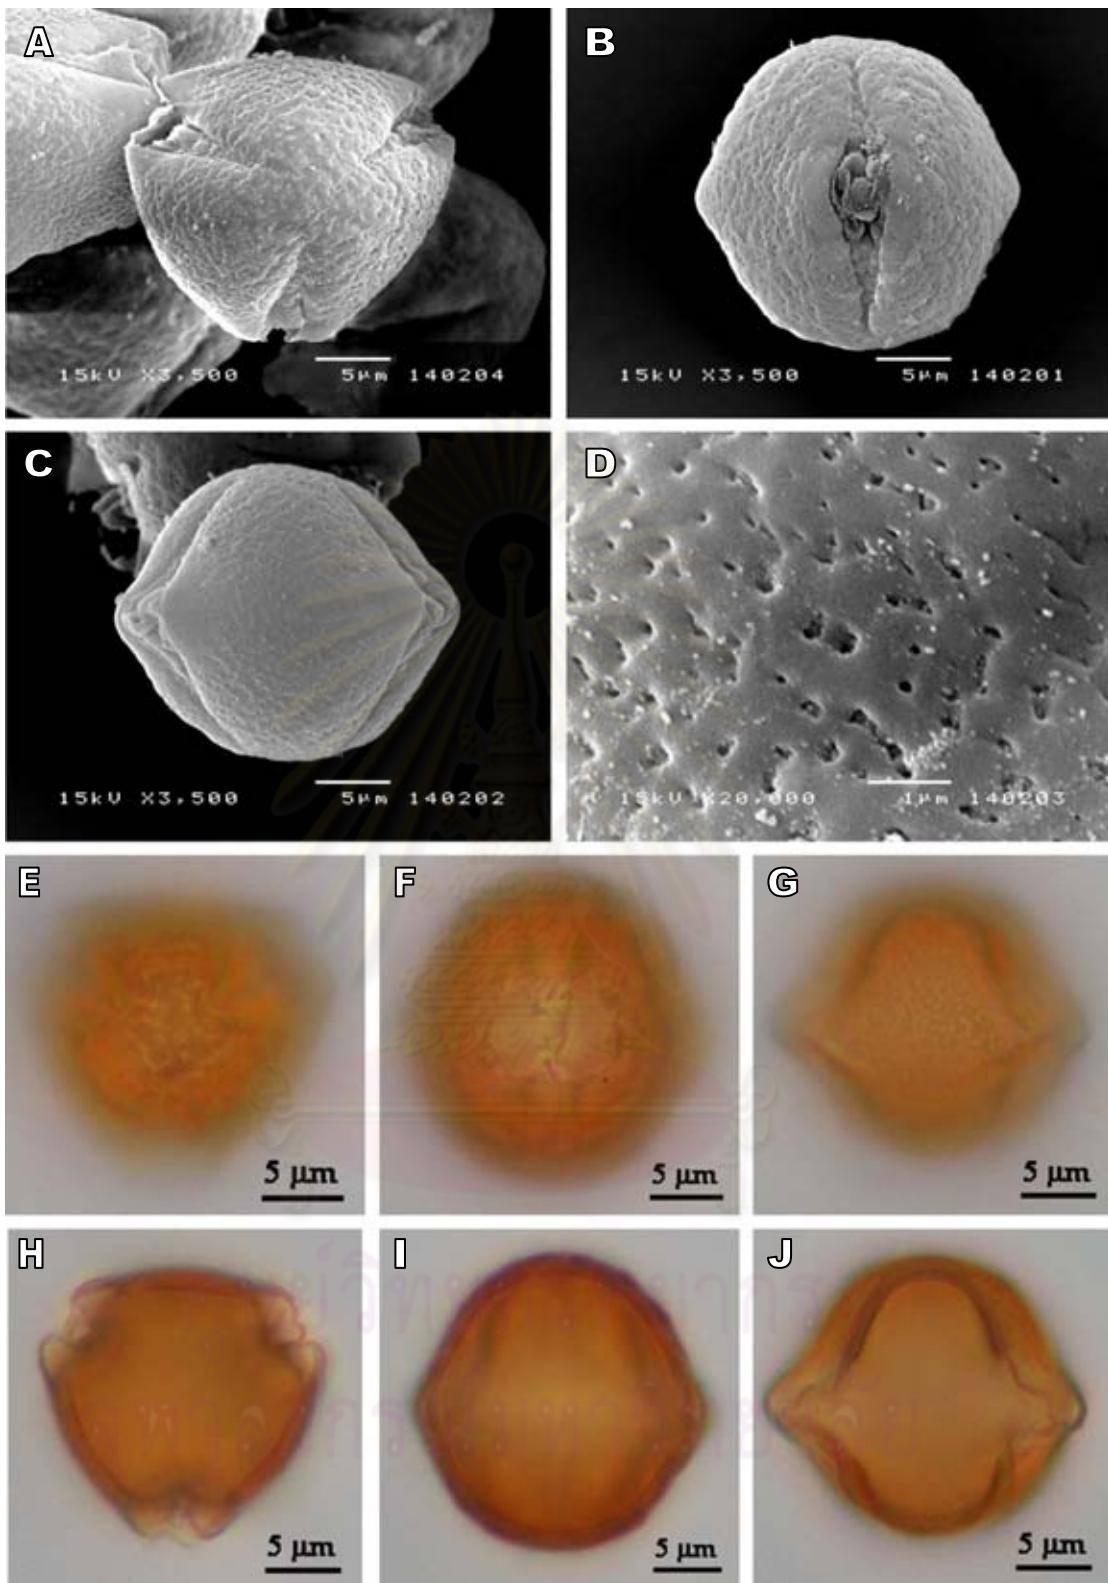

Plate 37 *Pongamia pinnata* (L.) Merr.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

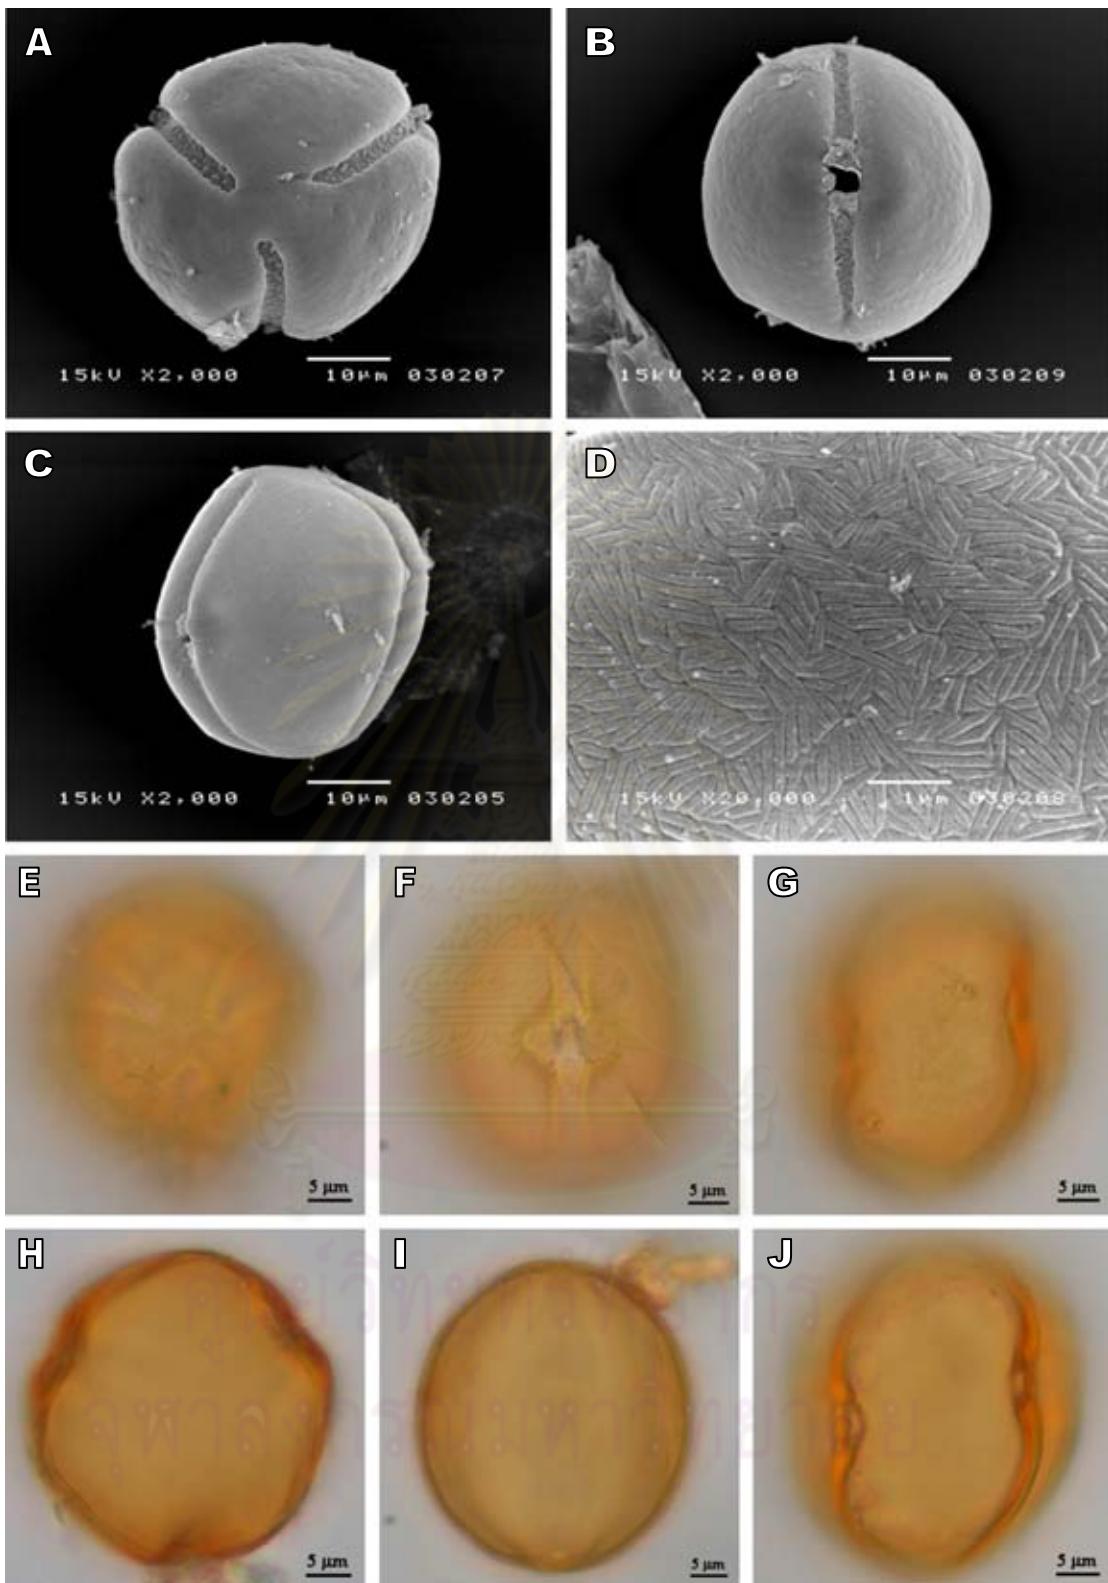

Plate 38 *Diospyros areolata* King & Gamble: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

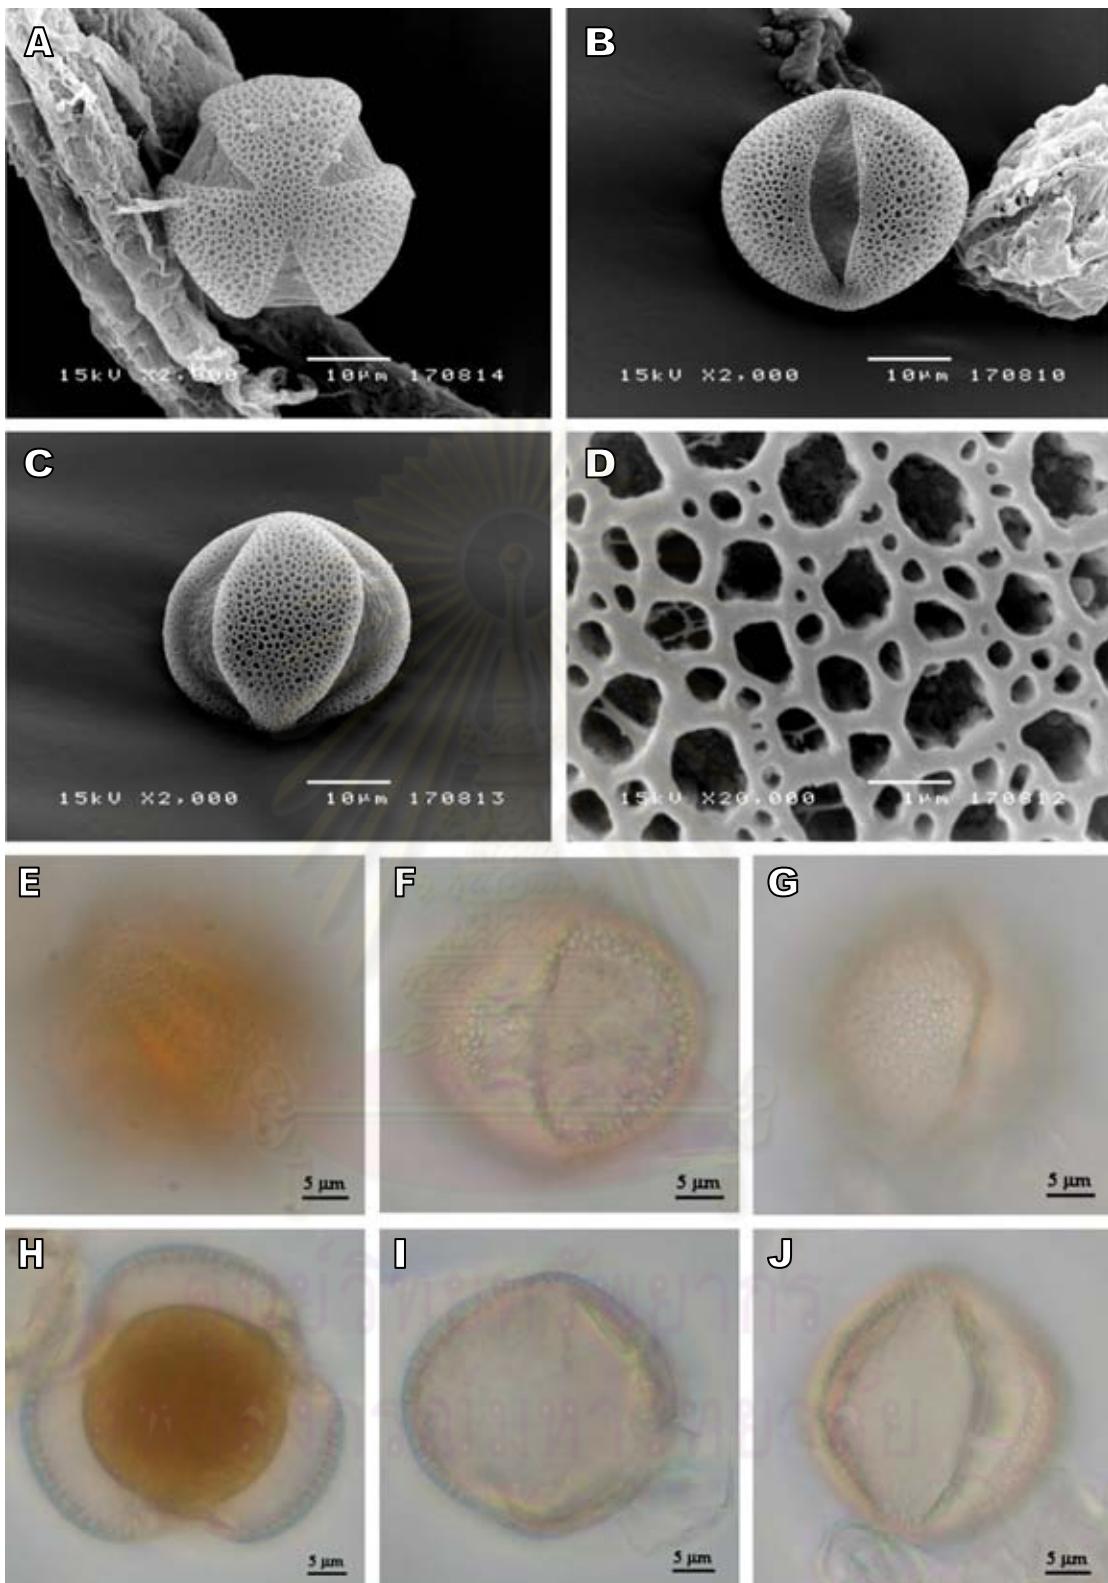

Plate 39 *Dolichandrone spathacea* (L. f.) Seem.: (A) Polar view, (B) Equatorial view, colpus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, colpus, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colpus, (J) Optical section under mesocolpium at costa colpi (A-D: SEM; E-J: LM).

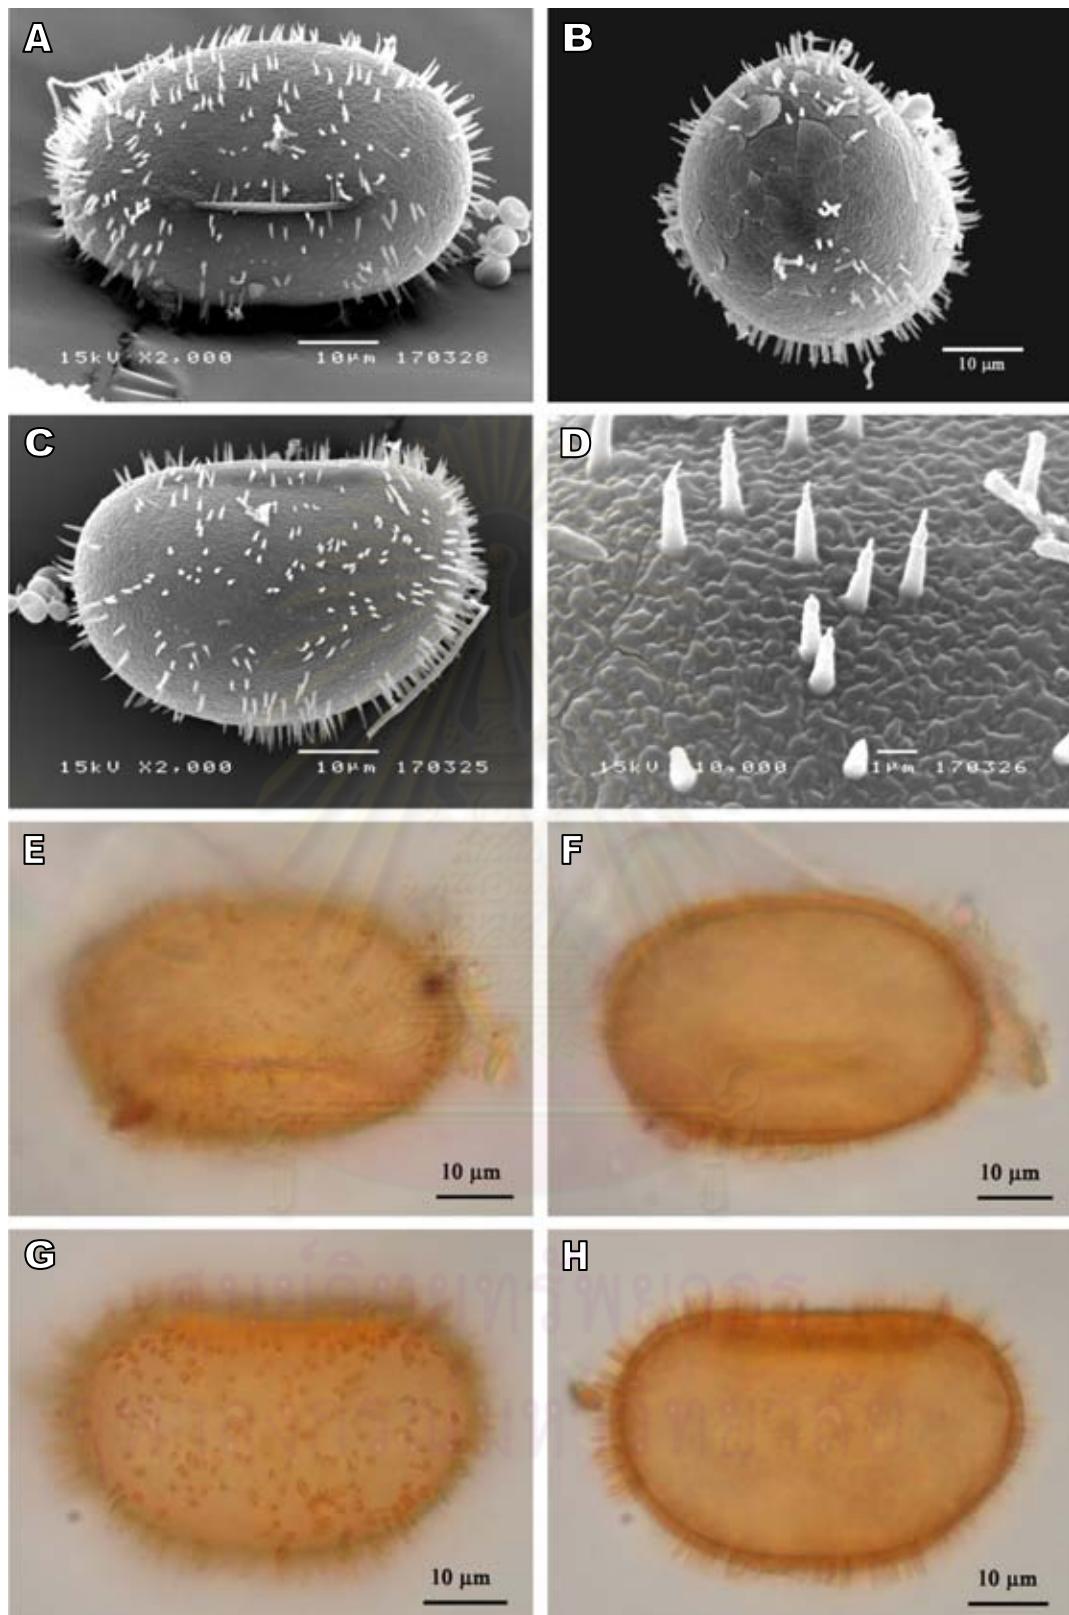

Plate 40 *Drynaria quercifolia* (L.) J. Sm.: (A) Polar view, laesura, (B) Shorter equatorial view, (C) Longer equatorial view, (D) Equatorial view, surface, (E) Polar view, laesura, (F) Polar view, optical section, (G) Longer equatorial view, surface, (H) Longer equatorial view, optical section (A-D: SEM; E-H: LM).

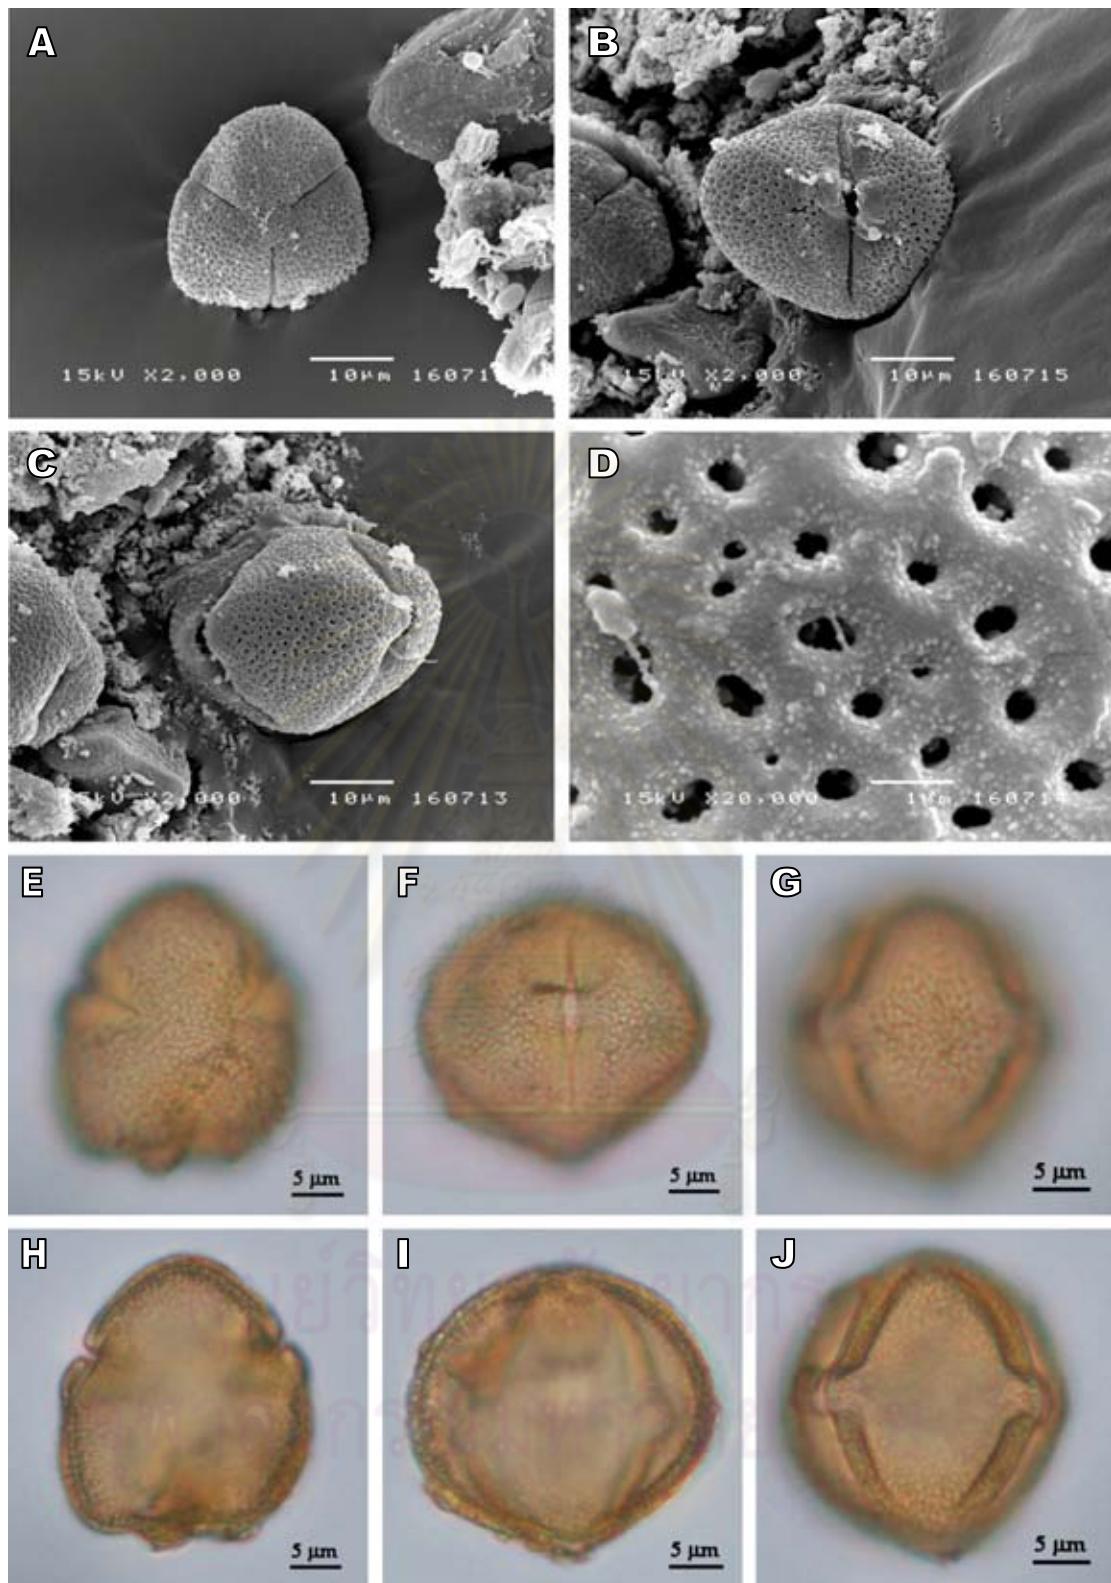

Plate 41 *Excoecaria agallocha* L.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

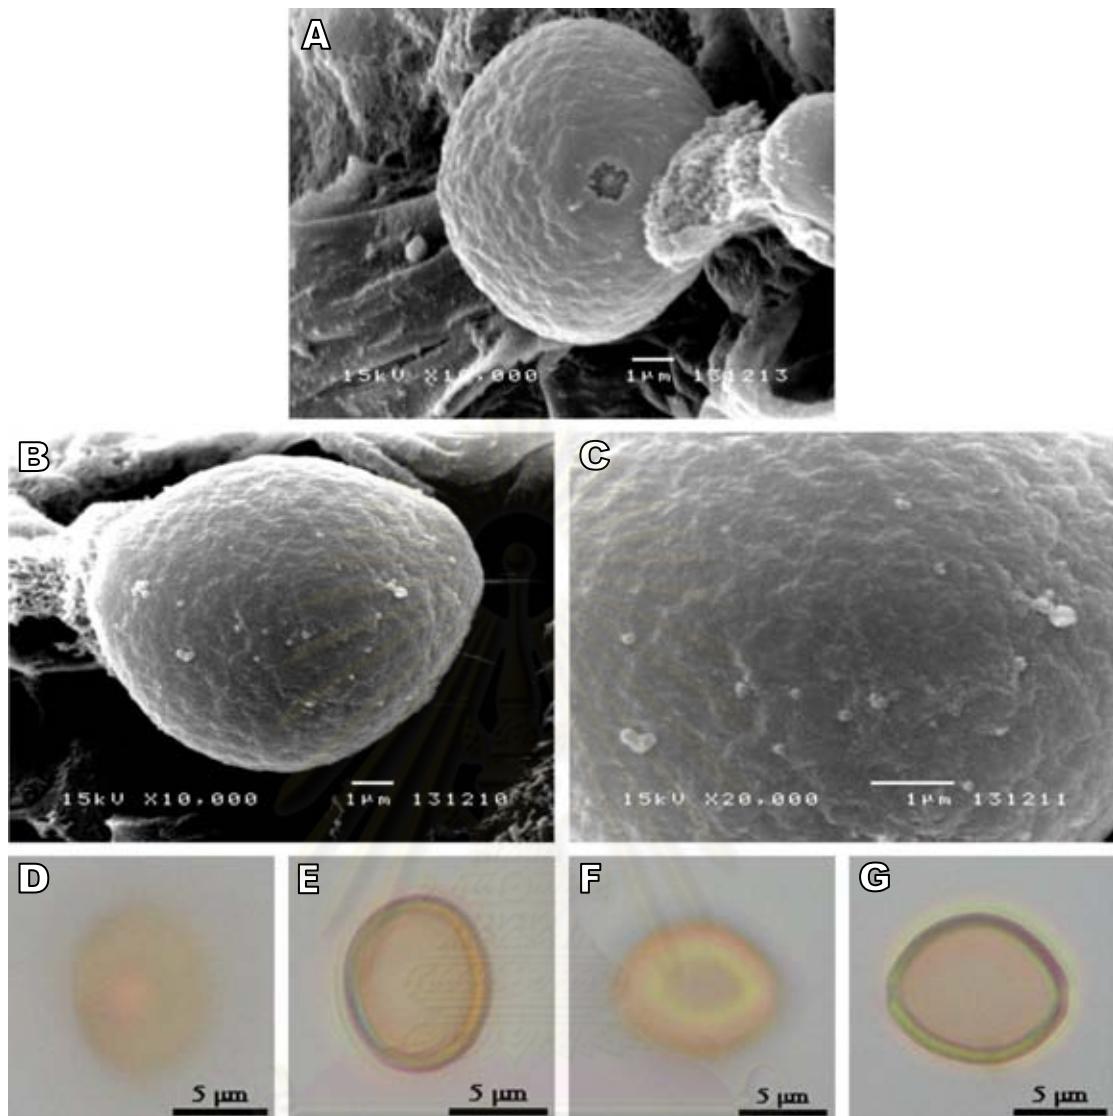

Plate 42 *Ficus microcarpa* L. f.: (A) Shorter equatorial view, porus, (B) Longer equatorial view, mesoporum, (C) Equatorial view, surface, (D) Shorter equatorial view, porus, (E) Shorter equatorial view, optical section, (F) Longer equatorial view, mesoporum surface, (G) Longer equatorial view, optical section (A-C: SEM; D-G: LM).

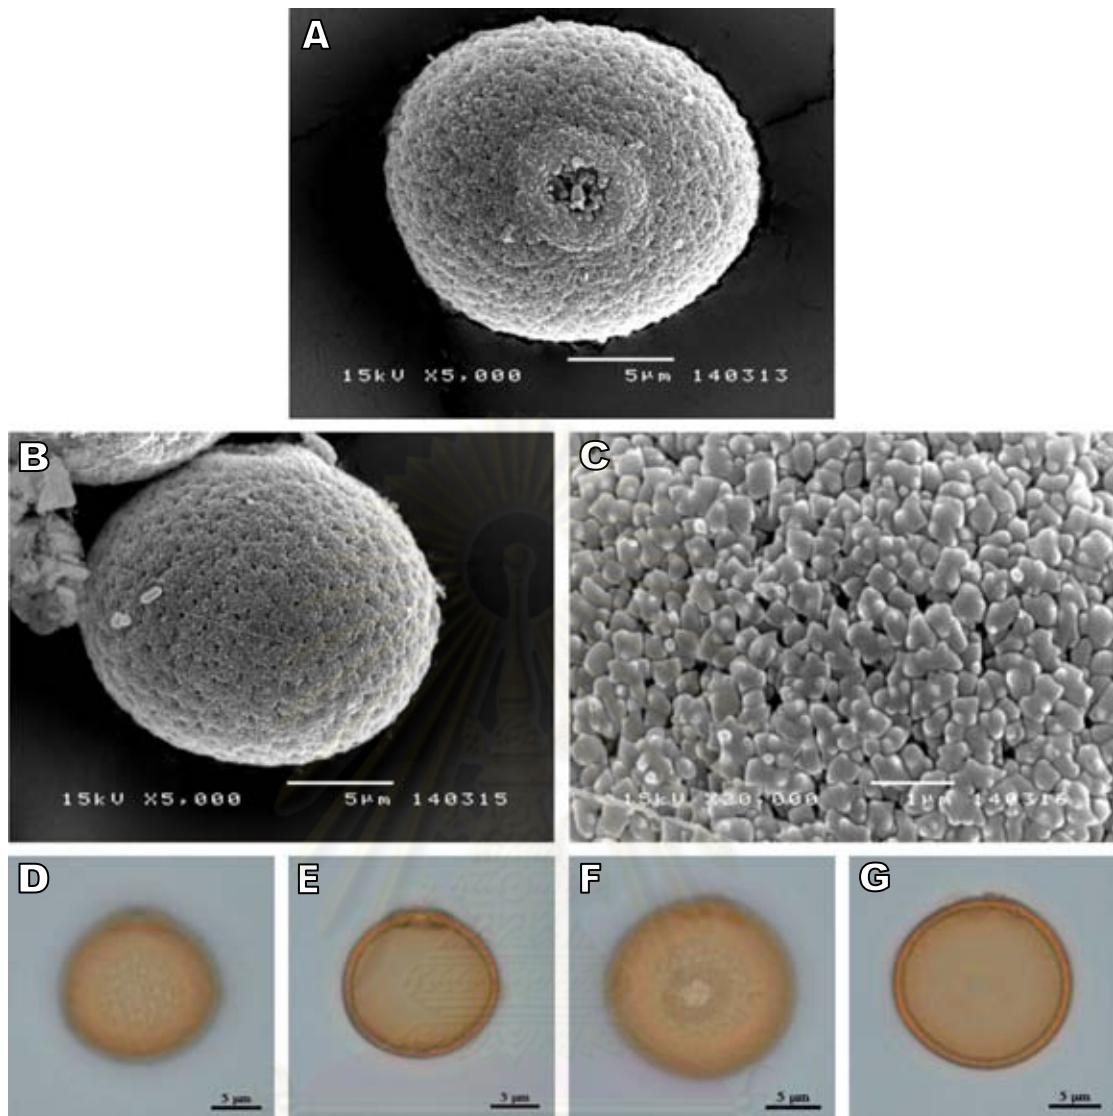

Plate 43 *Flagellaria indica* L.: (A) Polar view, porus, (B) Equatorial view, (C) Surface, (D) Equatorial view, surface, (E) Equatorial view, optical section, (F) Polar view, porus, (G) Polar view, optical section (A-C: SEM; D-G: LM).

คุณวิทยารพยากร
จุฬาลงกรณ์มหาวิทยาลัย

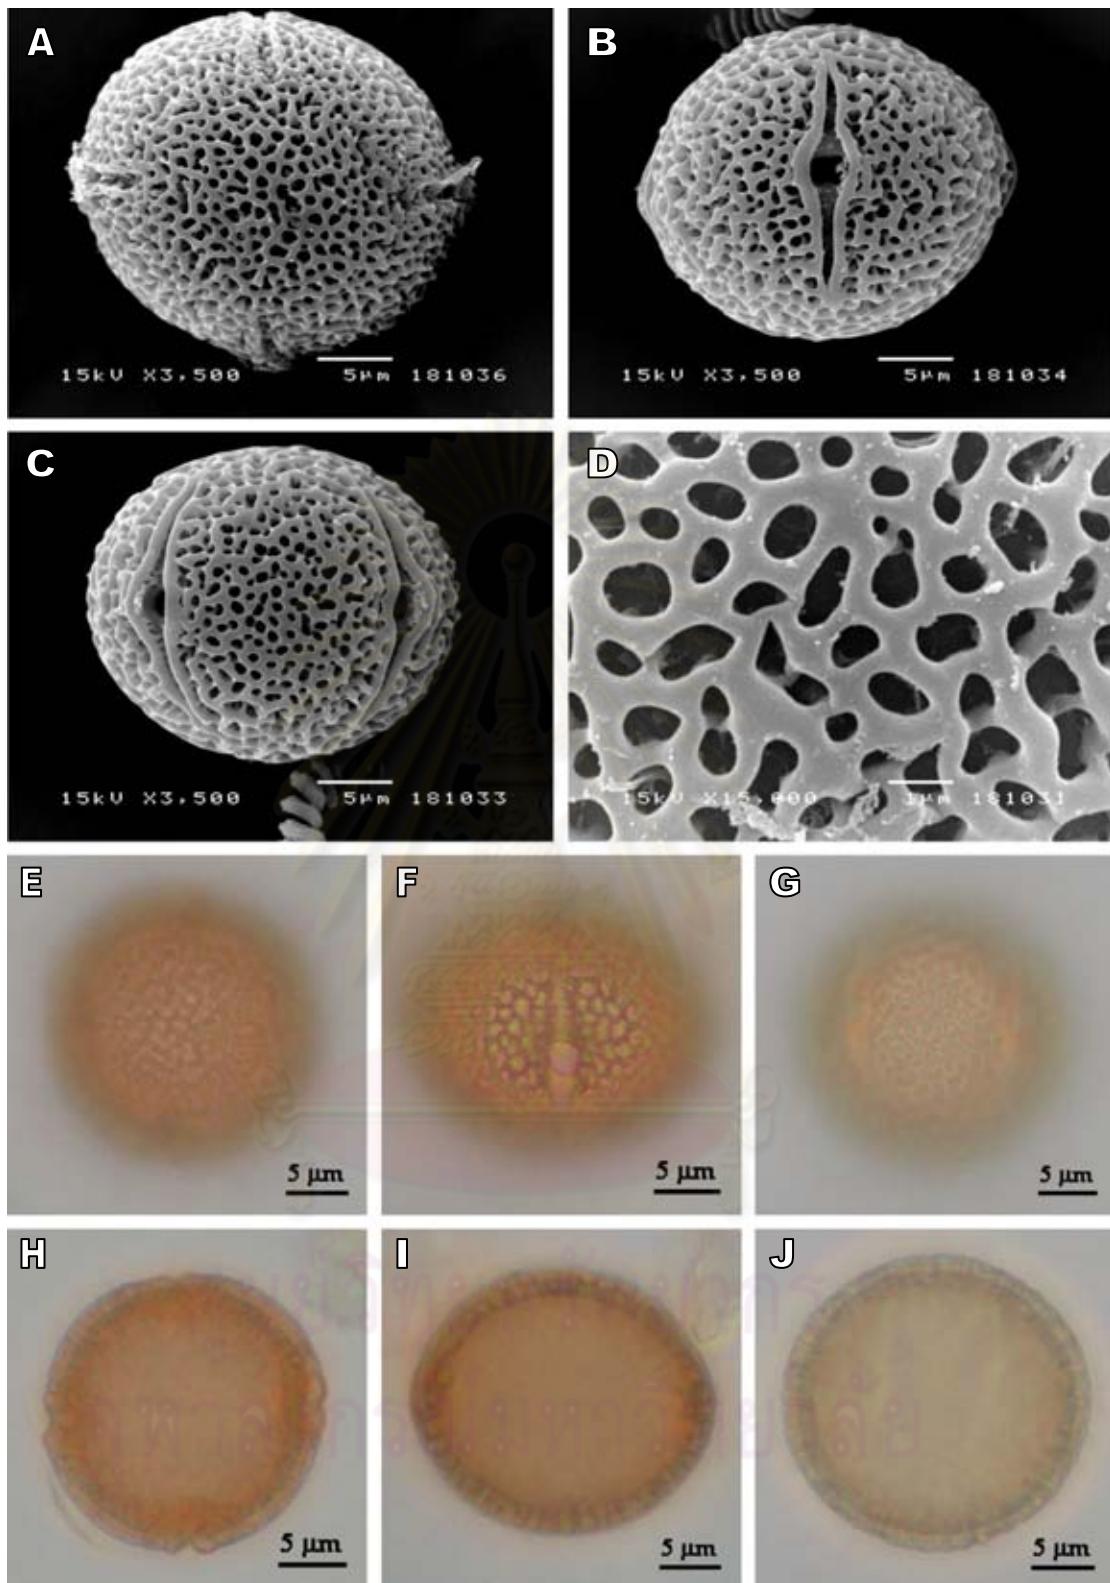

Plate 44 *Glochidion littorale* Blume: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

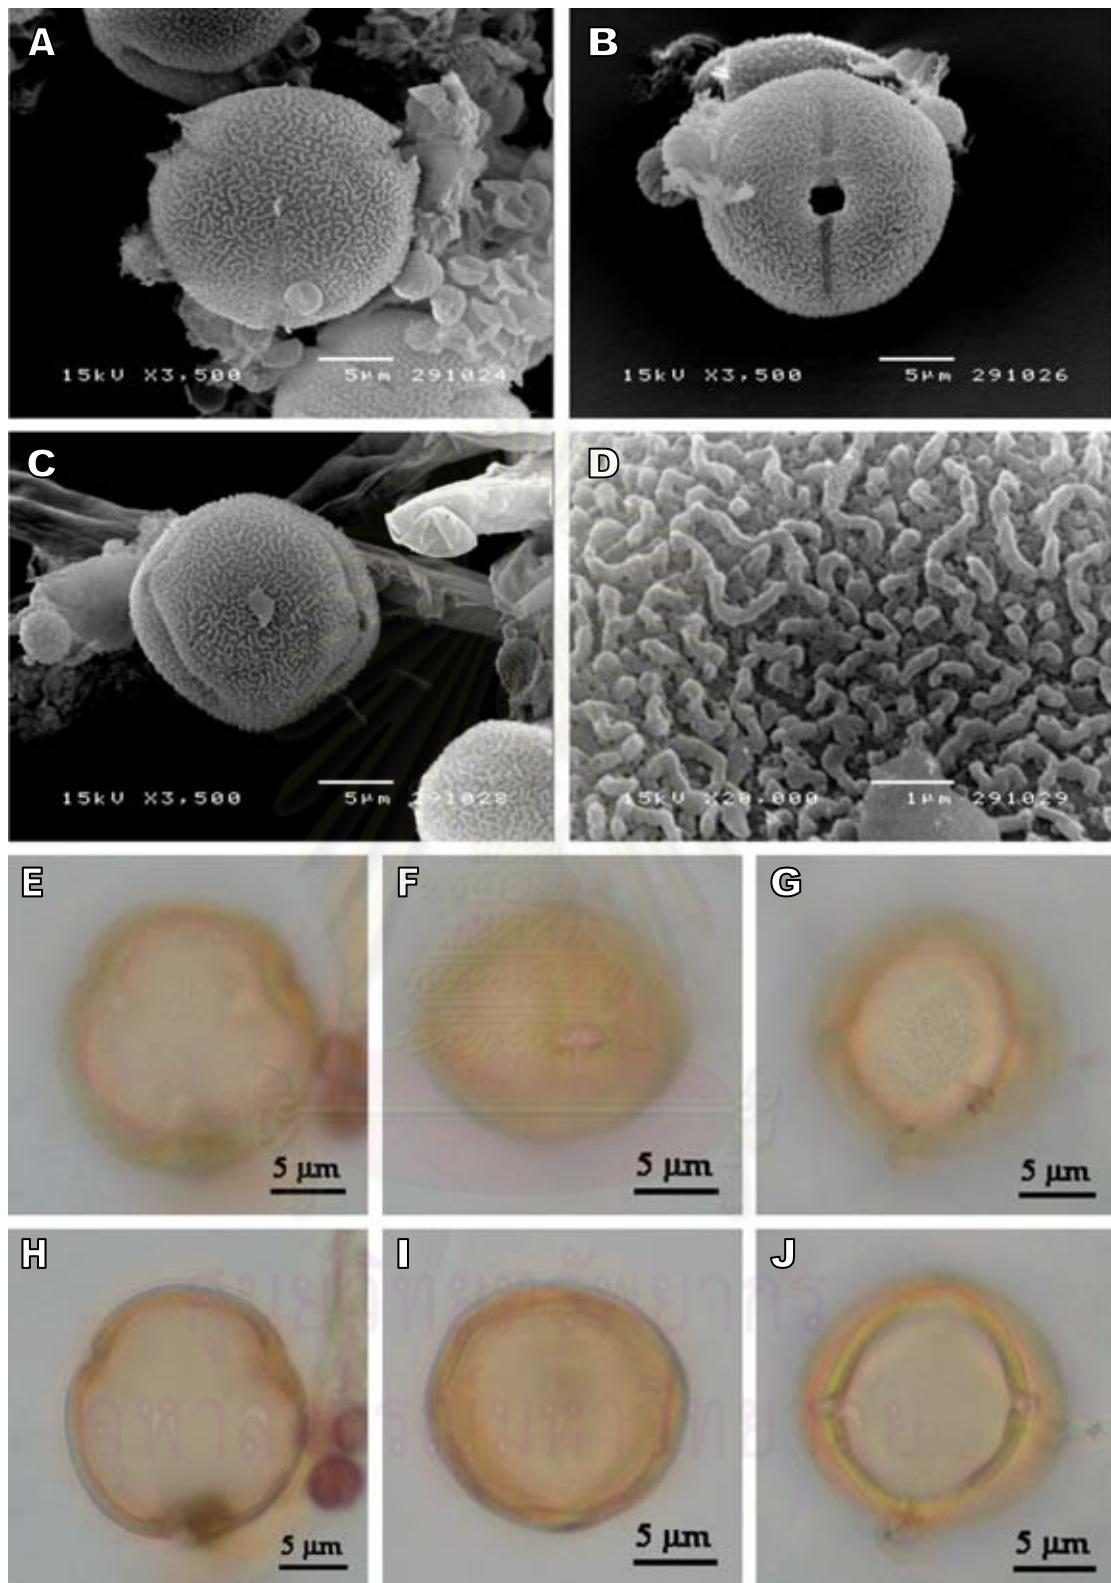

Plate 45 *Heritiera littoralis* Aiton: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

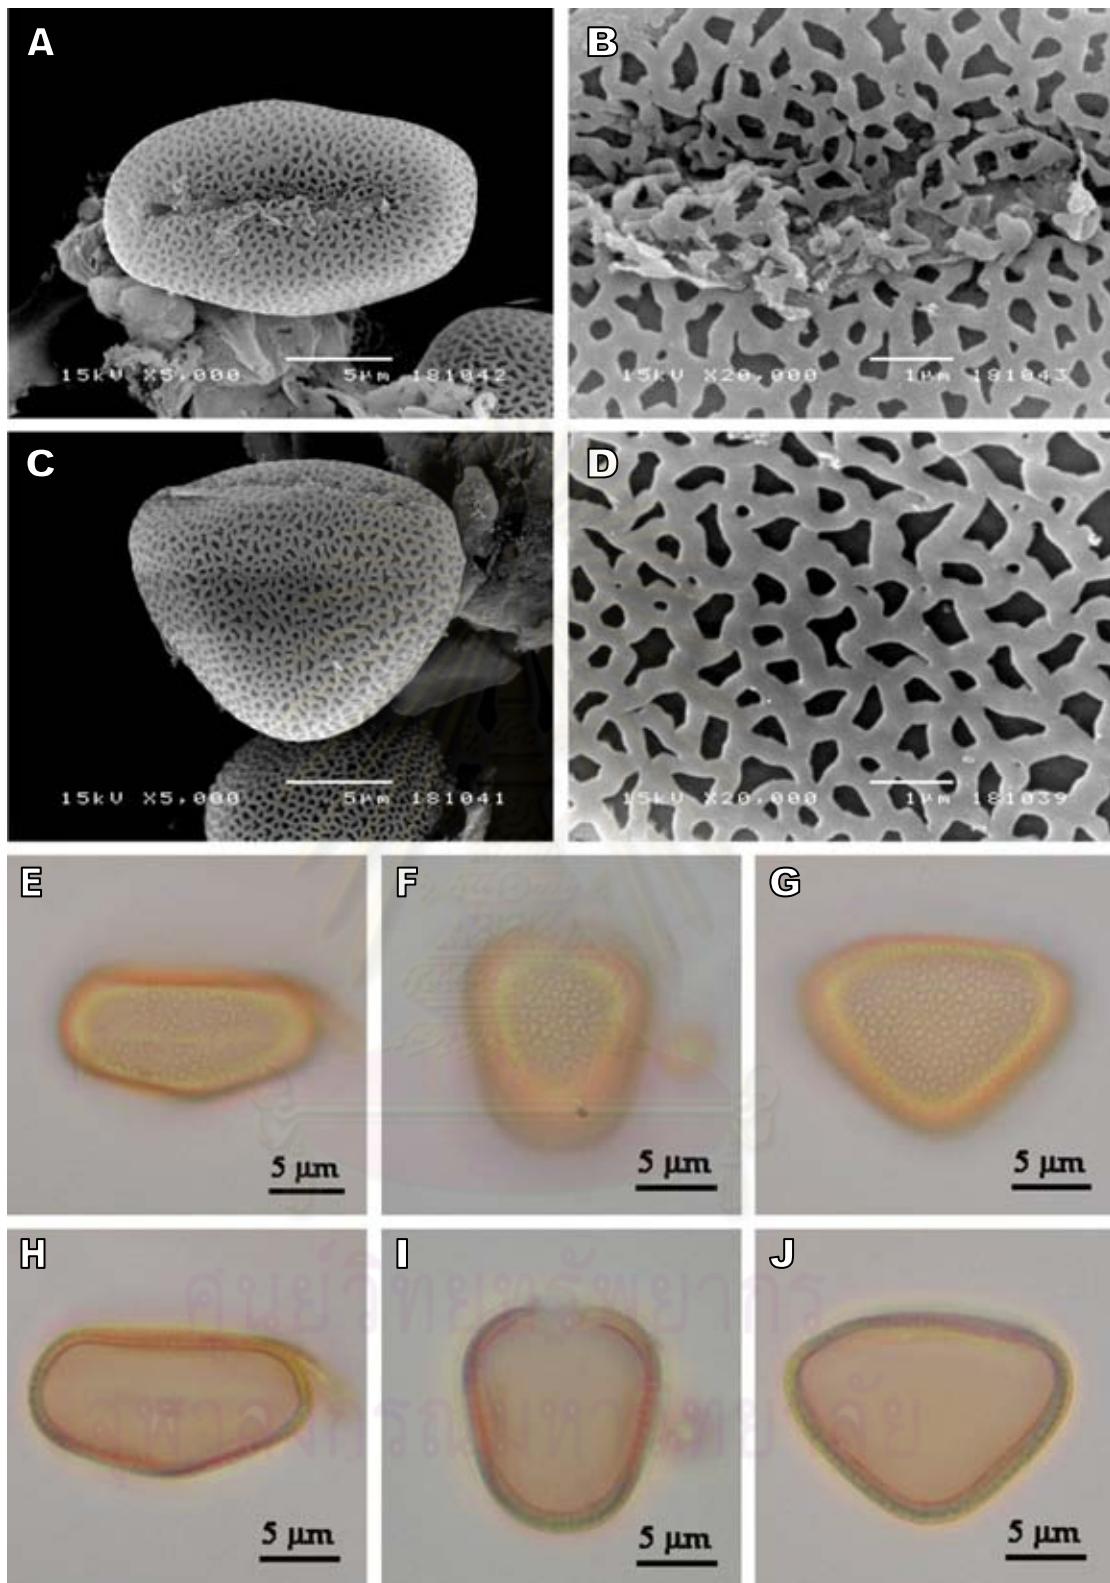

Plate 46 *Horsfieldia irya* (Gaertn.) Warb.: (A) Polar view, (B) Colpus, (C) Longer equatorial view, (D) Equatorial view, surface, (E) Polar view, colpus, (F) Shorter equatorial view, surface, (G) Longer equatorial view, surface, (H) Polar view, optical section, (I) Shorter equatorial view, optical section, (J) Longer equatorial view, optical section (A-D: SEM; E-J: LM).

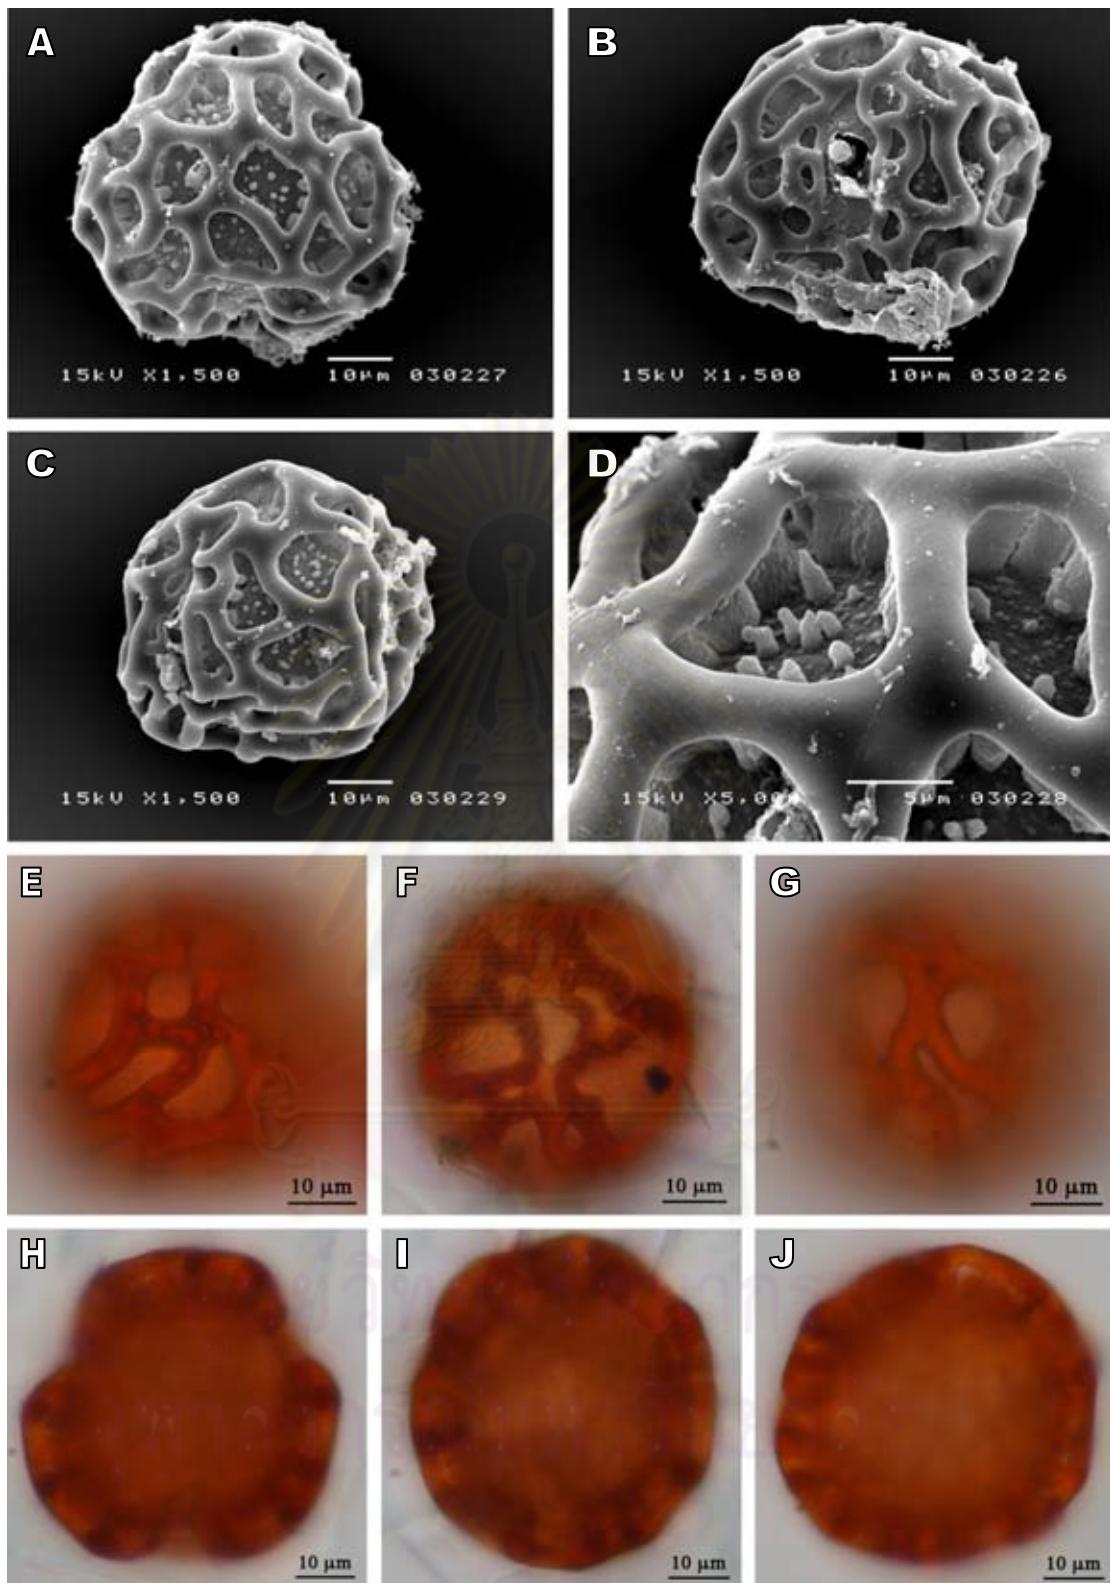

Plate 47 *Intzia bijuga* (Colebr.) Kuntze: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

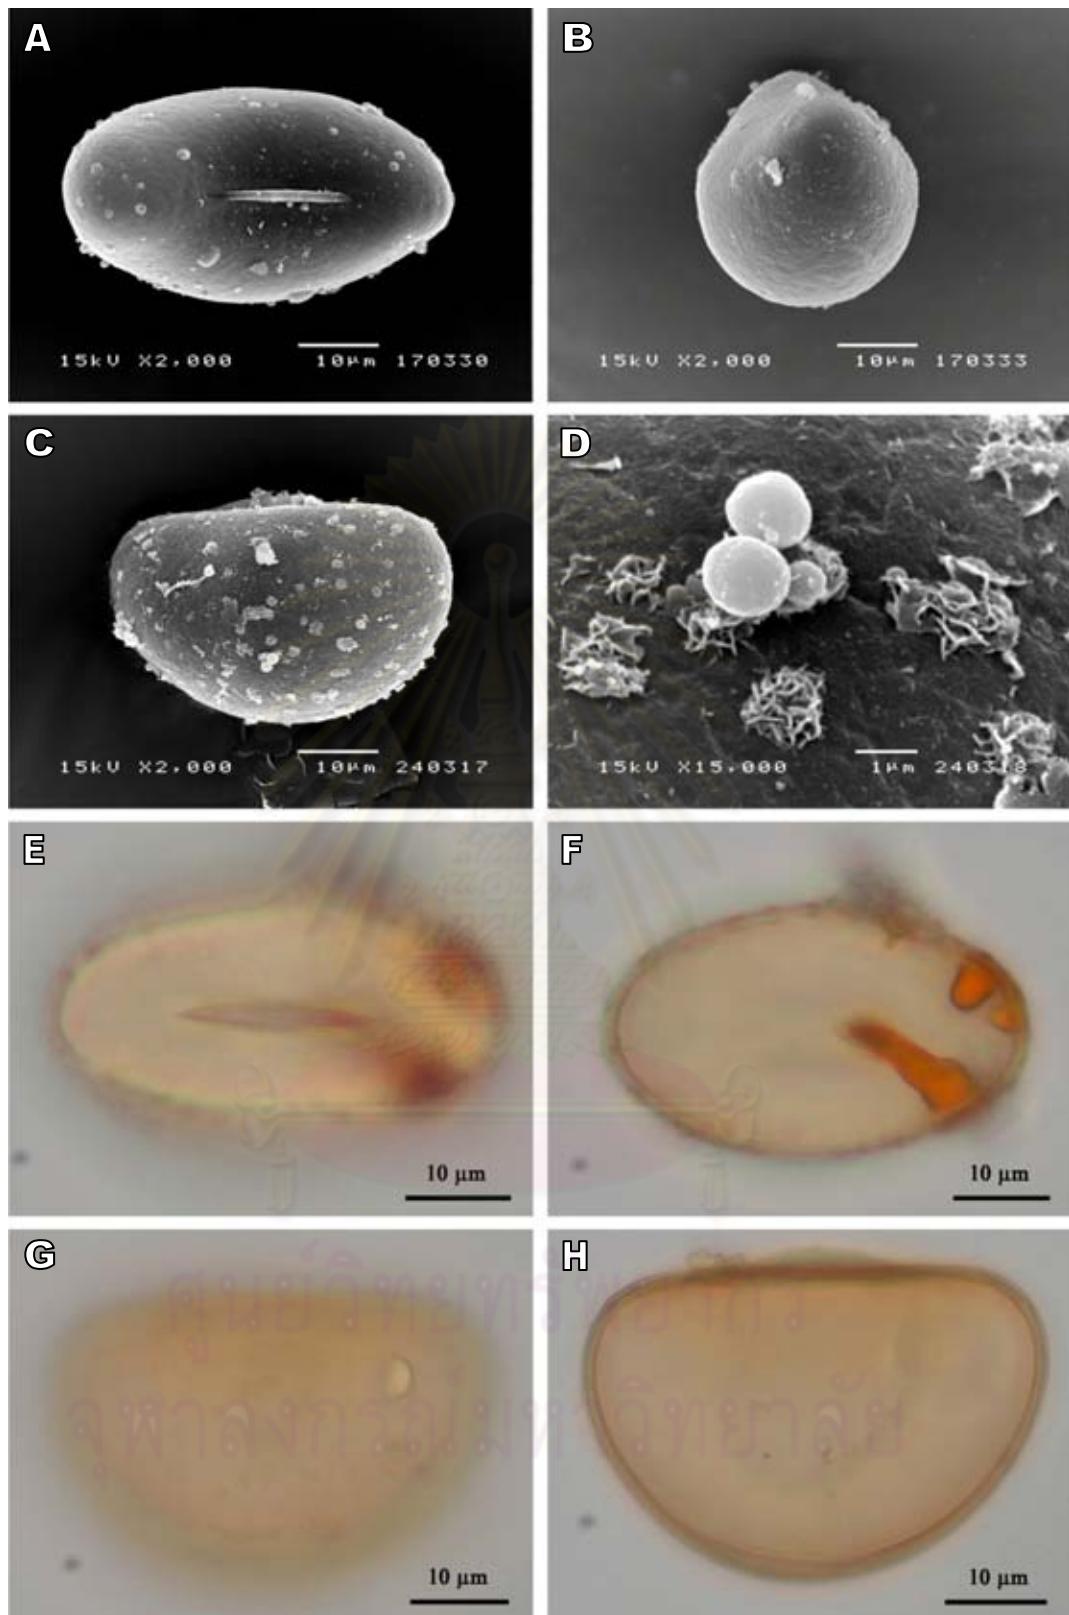

Plate 48 *Lecanopteris sinuosa* (Wall. ex Hook.) Copel.: (A) Polar view, laesura, (B) Shorter equatorial view, (C) Longer equatorial view, (D) Equatorial view, surface, (E) Polar view, laesura, (F) Polar view, optical section, (G) Longer equatorial view, surface, (H) Longer equatorial view, optical section (A-D: SEM; E-H: LM).

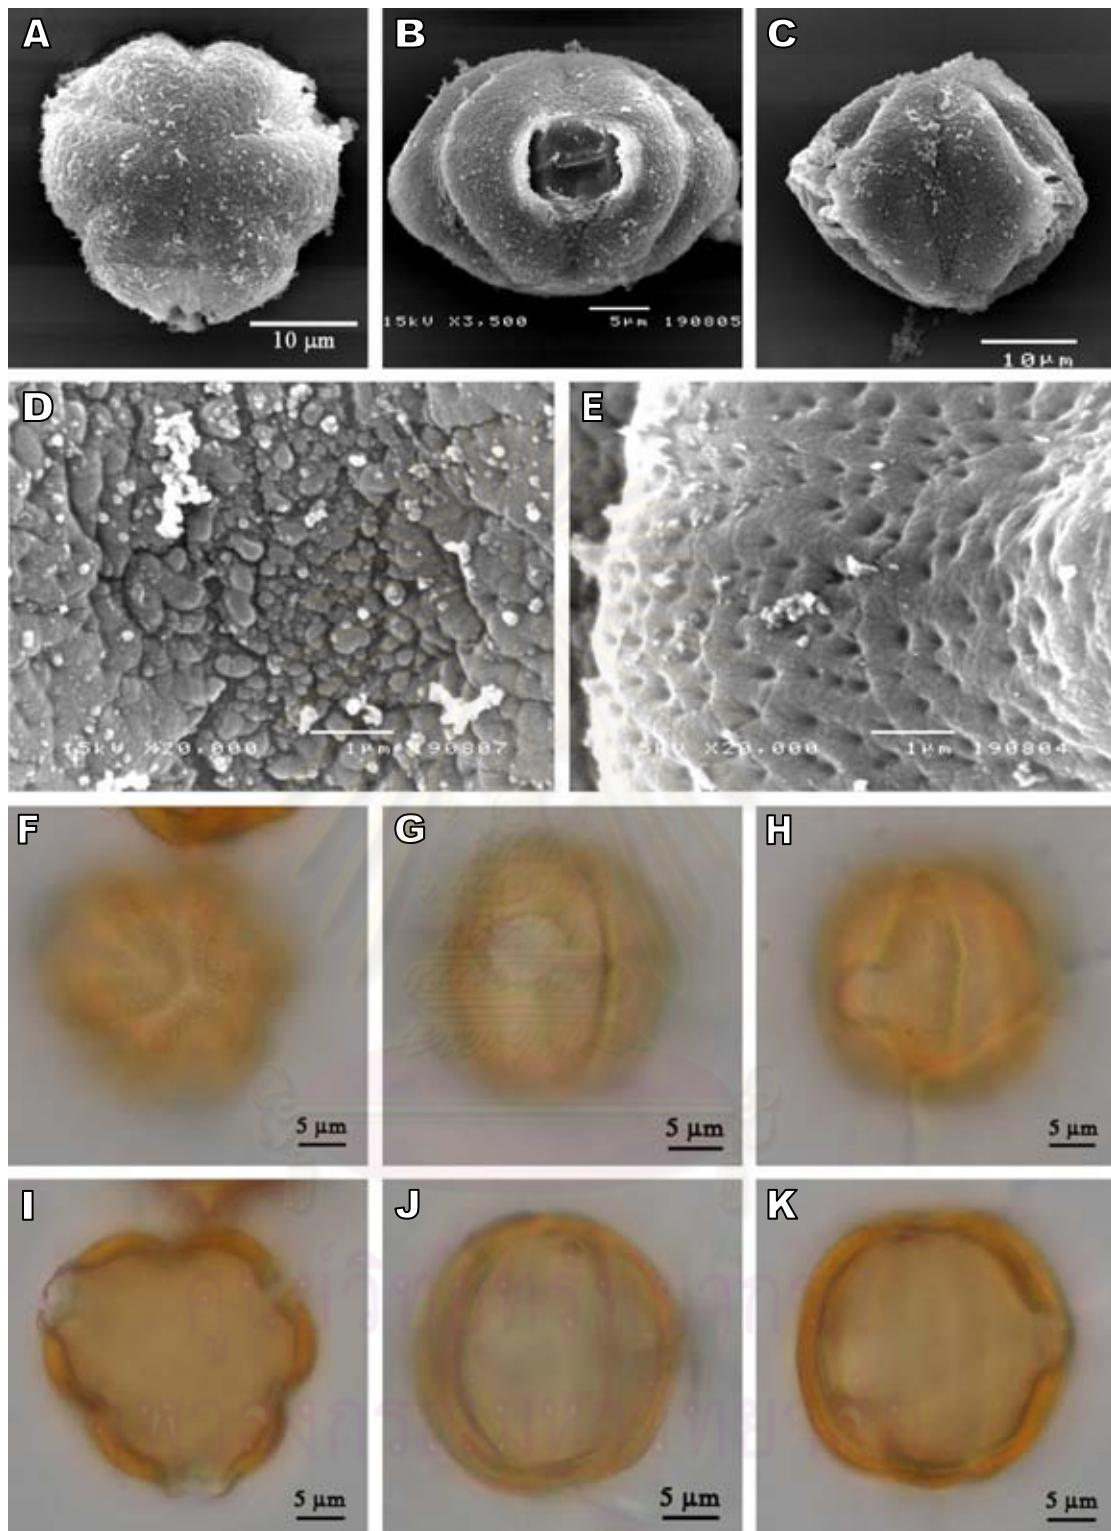

Plate 49 *Lumnitzera littorea* (Jack) Voigt: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, pseudocolpus, (D) Equatorial view, pseudocolpus surface, (E) Surface between true and pseudoaperture, (F) Polar view, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, pseudocolpus surface, (I) Polar view, optical section, (J) Optical section under colporus, (K) Optical section under pseudocolpus (A-E: SEM; F-K: LM).

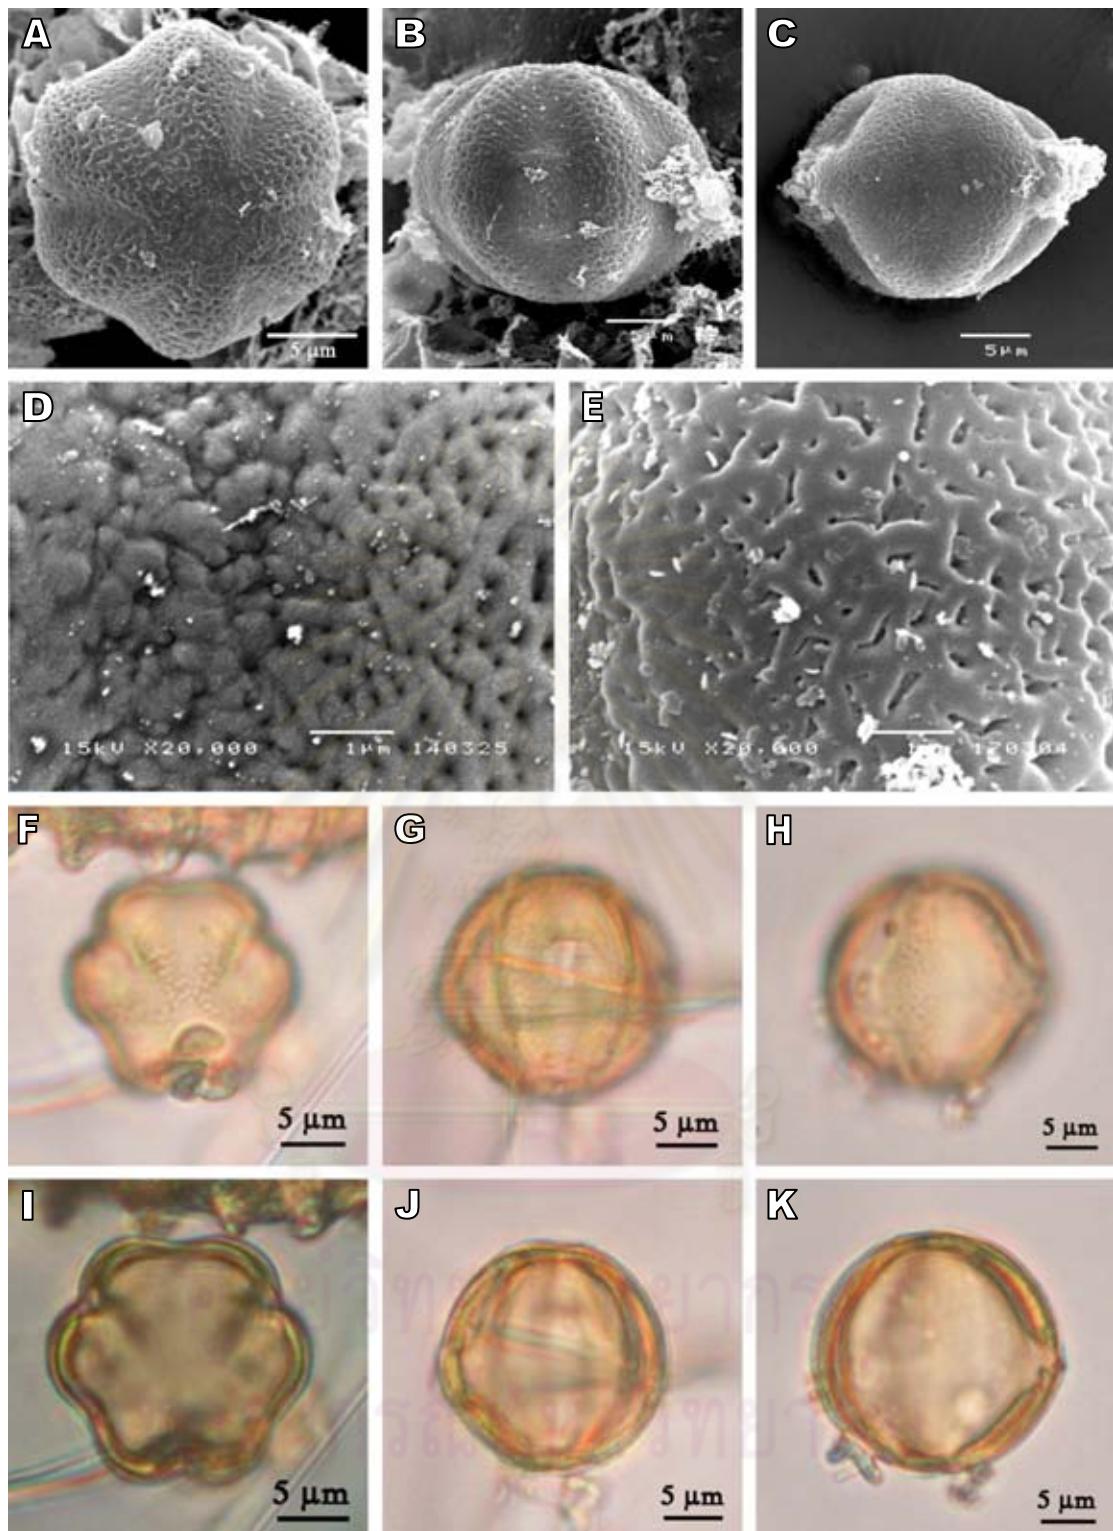

Plate 50 *Lumnitzera racemosa* Willd.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, pseudocolpus, (D) Equatorial view, pseudocolpus surface, (E) Surface between true and pseudoaperture, (F) Polar view, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, pseudocolpus surface, (I) Polar view, optical section, (J) Optical section under colporus, (K) Optical section under pseudocolpus (A-E: SEM; F-K: LM).

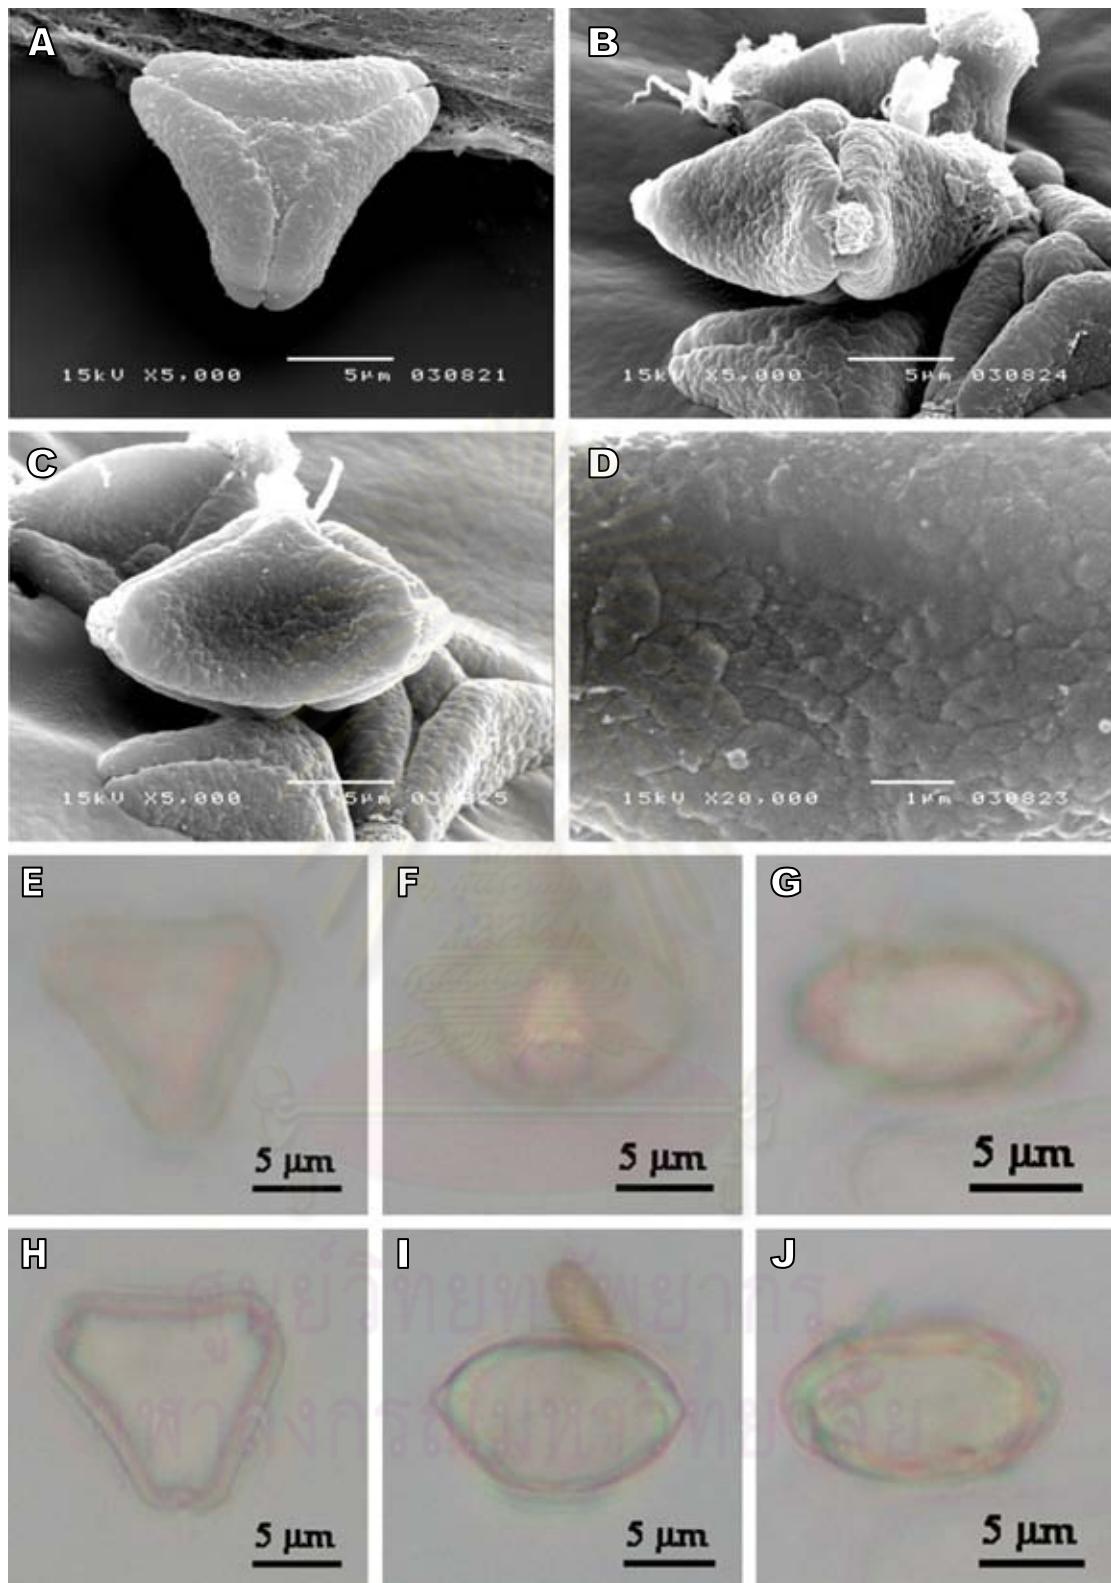

Plate 51 *Melaleuca cajuputi* Powell: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

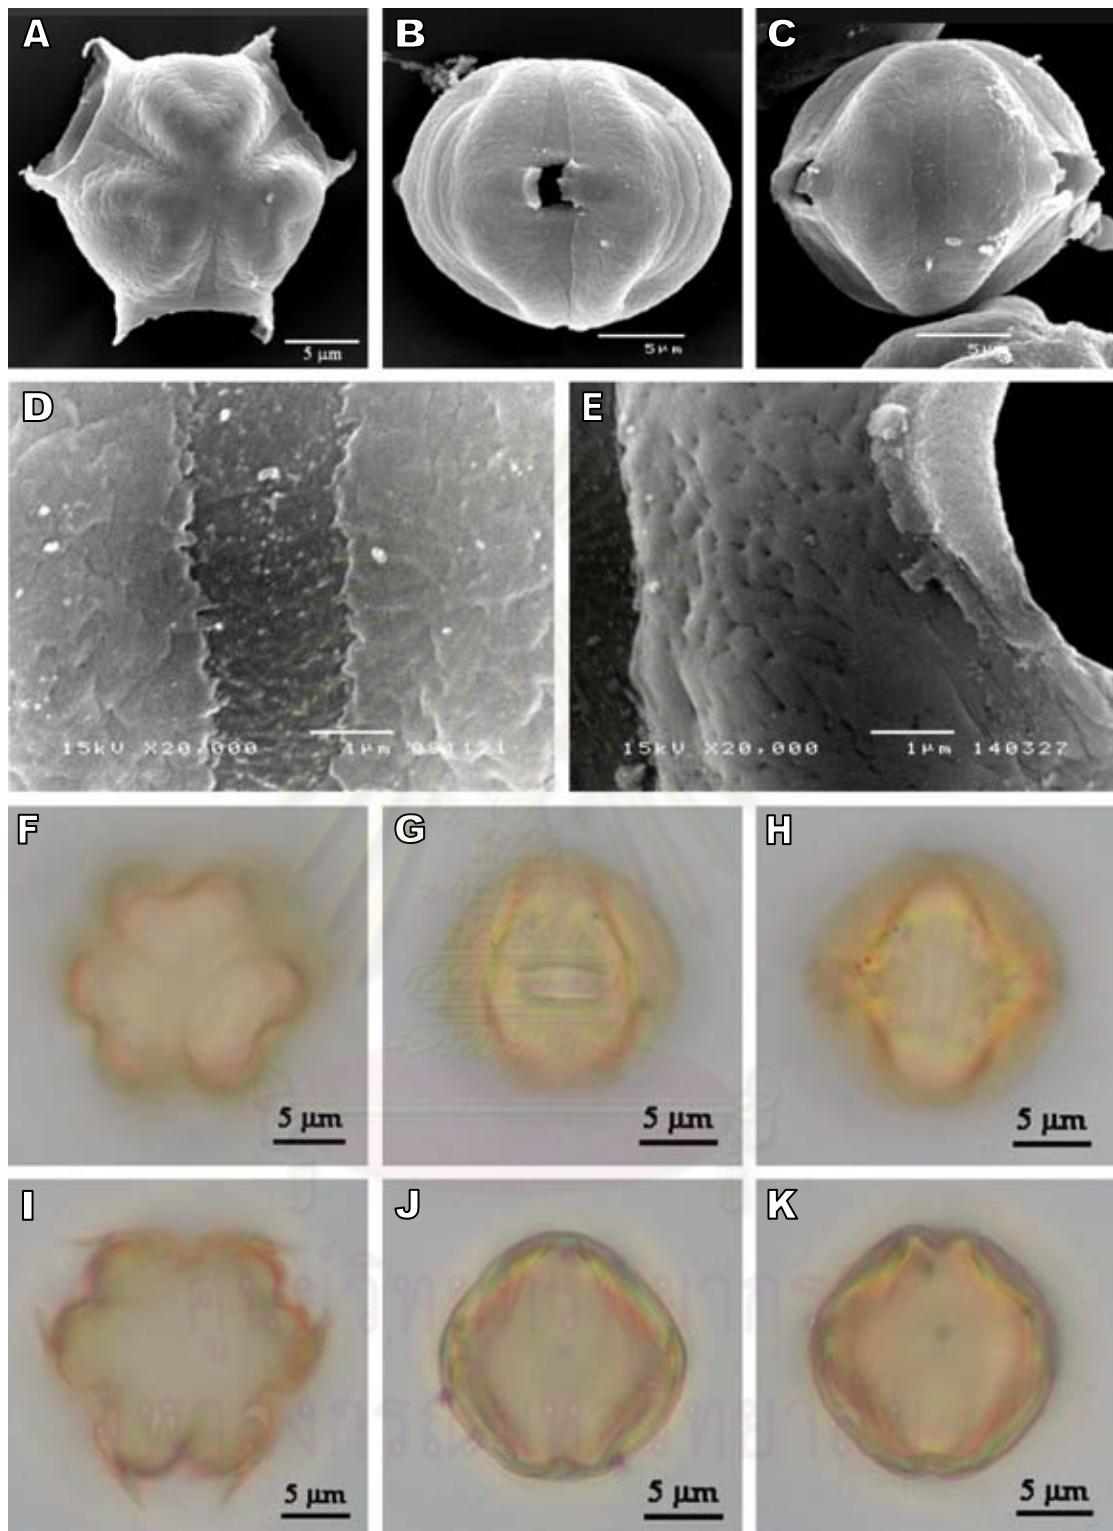

Plate 52 *Melastoma saigonense* (Kuntze) Merr.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, pseudocolpus, (D) Equatorial view, pseudocolpus surface, (E) Surface between true and pseudoaperture, (F) Polar view, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, pseudocolpus surface, (I) Polar view, optical section, (J) Optical section under colporus, (K) Optical section under pseudocolpus (A-E: SEM; F-K: LM).

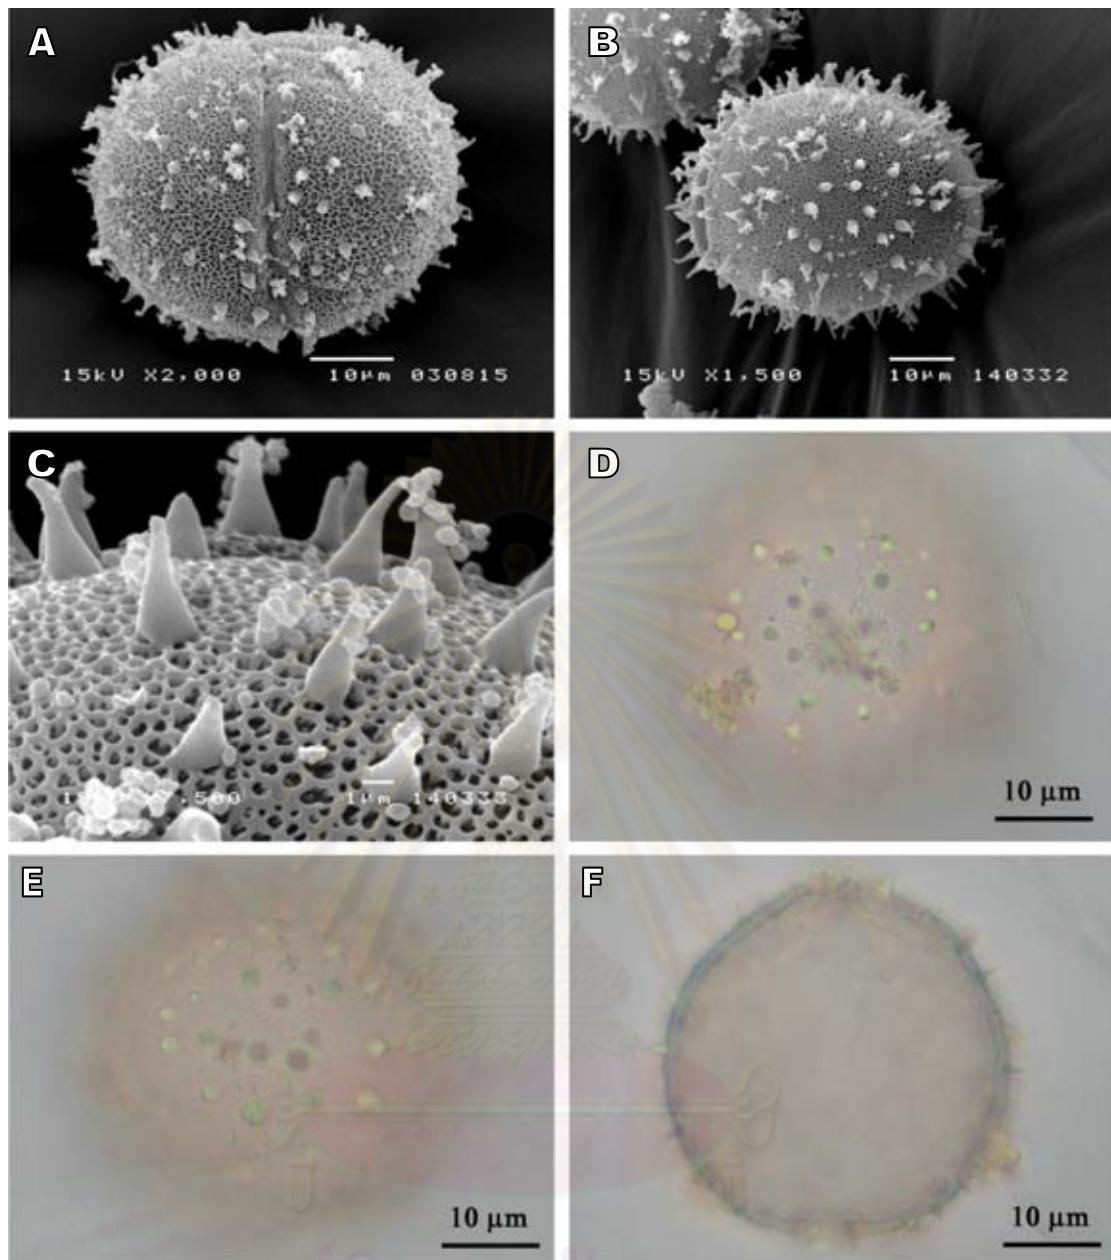

Plate 53 *Nypa fruticans* Wurmb: (A) Colpus, (B) Equatorial view, (C) Equatorial view, surface, (D) Colpus, (E) Equatorial view, surface, (F) Optical section under colpus (A-C: SEM; D-F: LM).

จุฬาลงกรณ์มหาวิทยาลัย

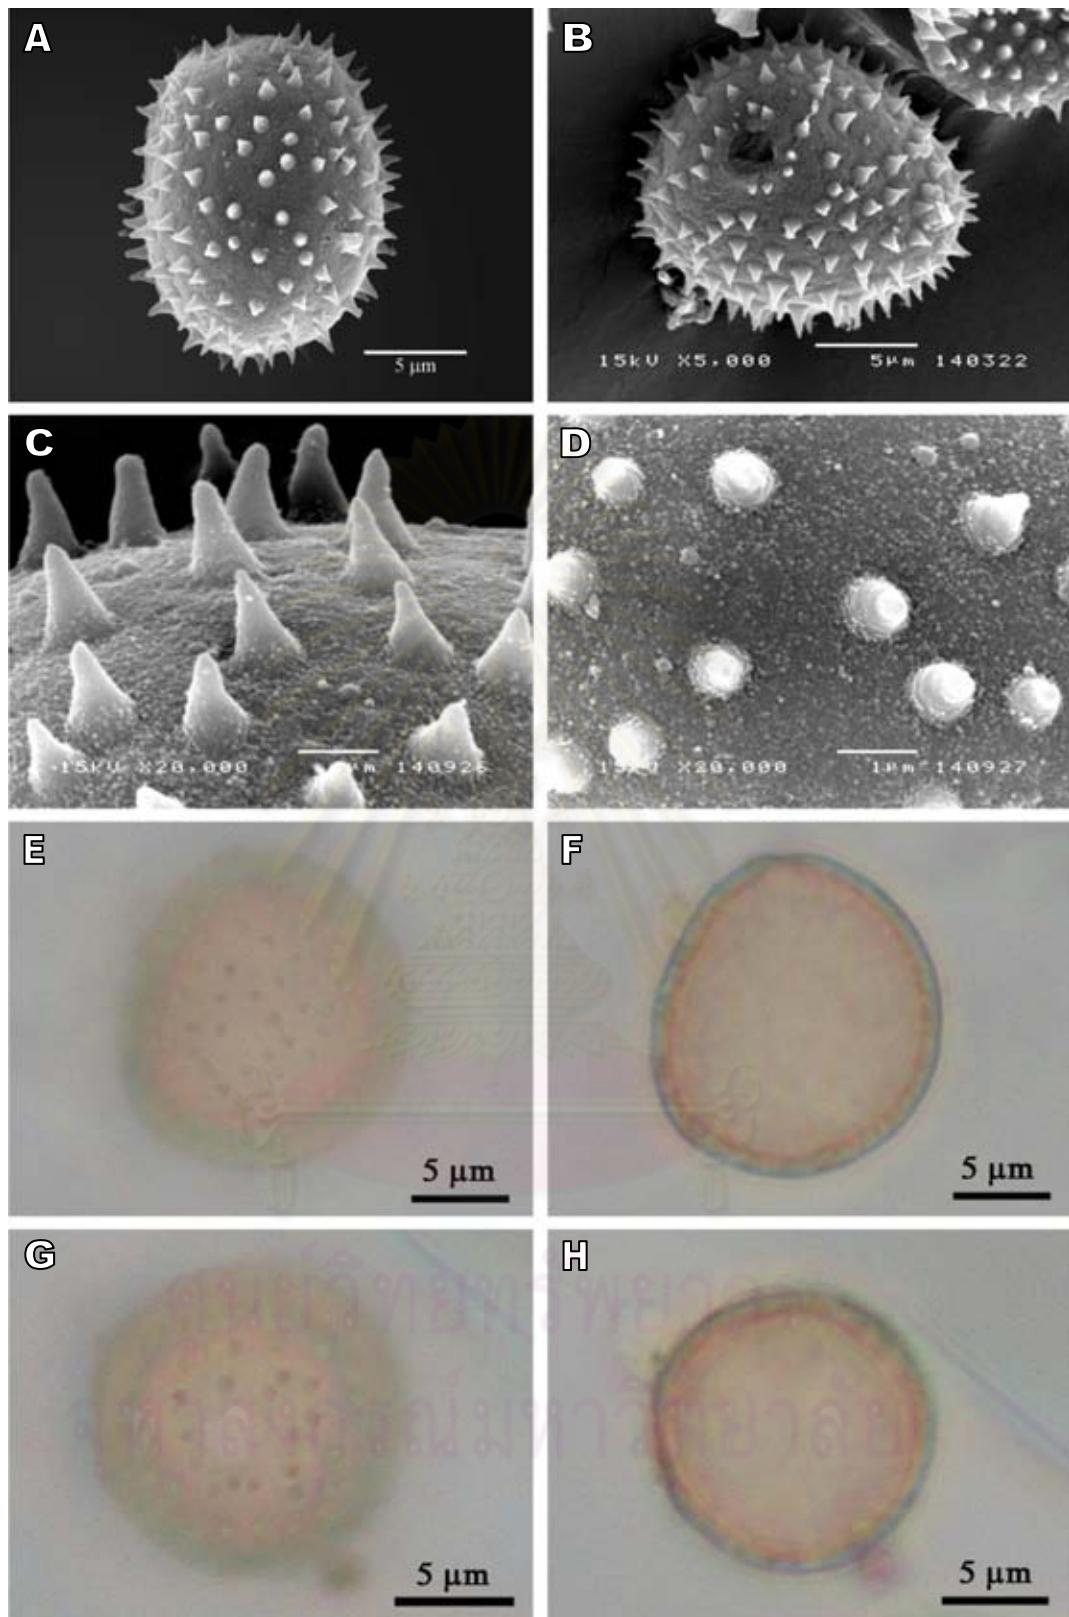

Plate 54 *Pandanus odoratissimus* L. f.: (A) Equatorial view, (B) Polar view, porus (C) Surface, side view, (D) Surface, top view, (E) Equatorial view, surface, (F) Equatorial view, optical section, (G) Polar view, surface, (H) Polar view, optical section (A-D: SEM; E-H: LM).

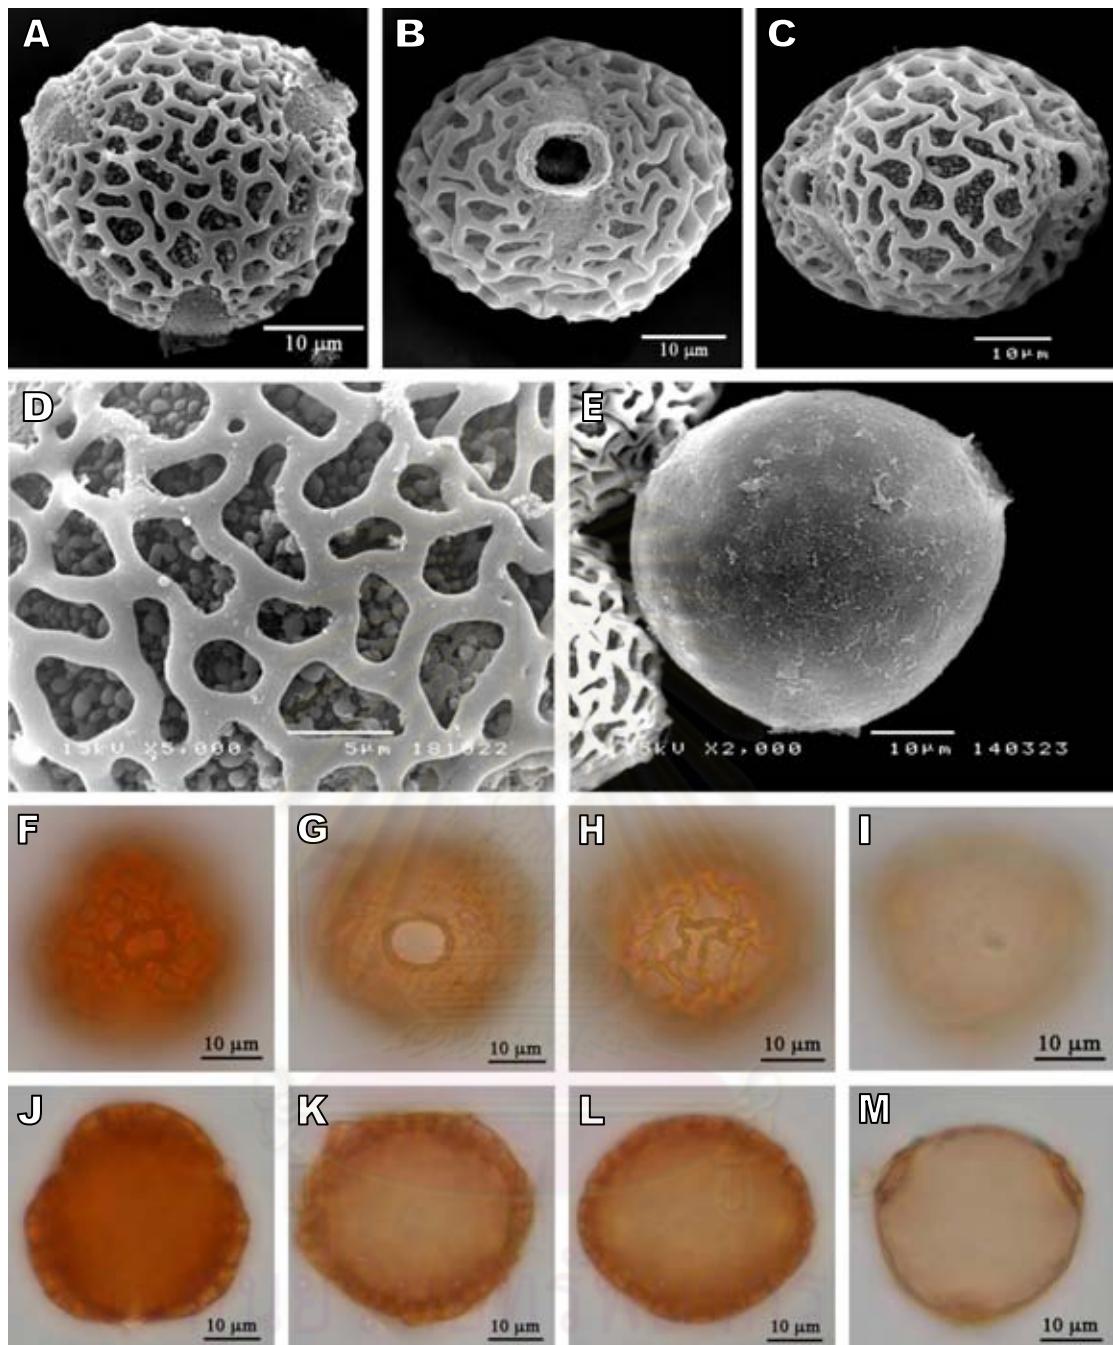

Plate 55 *Peltophorum pterocarpum* (DC.) Backer ex K. Heyne: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial, ornamentation, (E) Polar view of sexineless grain, (F) Polar view, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, mesocolpium surface, (I) Polar view of sexineless grain, surface, (J) Polar view, optical section, (K) Optical section under colporus, (L) Optical section under mesocolpium, (M) Polar view of sexineless grain, optical section at costa endoppori (A-E: SEM; F-M: LM).

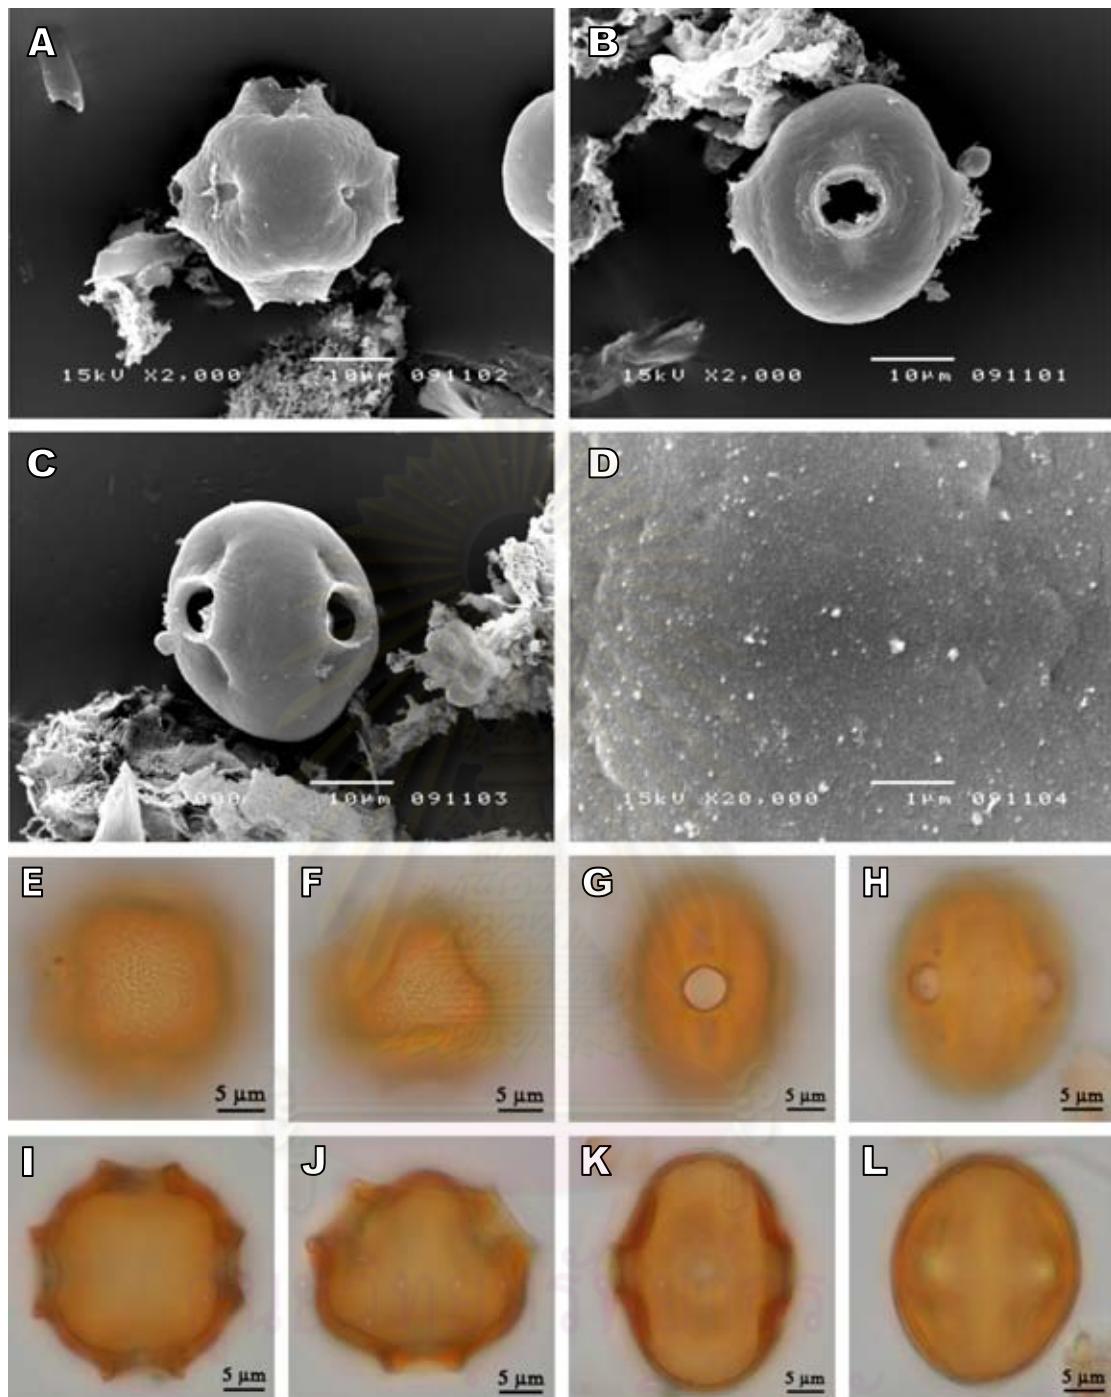

Plate 56 *Pemphix acidula* J.R. & G. Forst.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view of 4-aperturate grain, surface, (F) Polar view of 3-aperturate grain, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, mesocolpium surface, (I) Polar view of 4-aperturate grain, optical section, (J) Polar view of 3-aperturate grain, optical section, (K) Optical section under colporus, (L) Optical section under mesocolpium (A-D: SEM; E-L: LM).

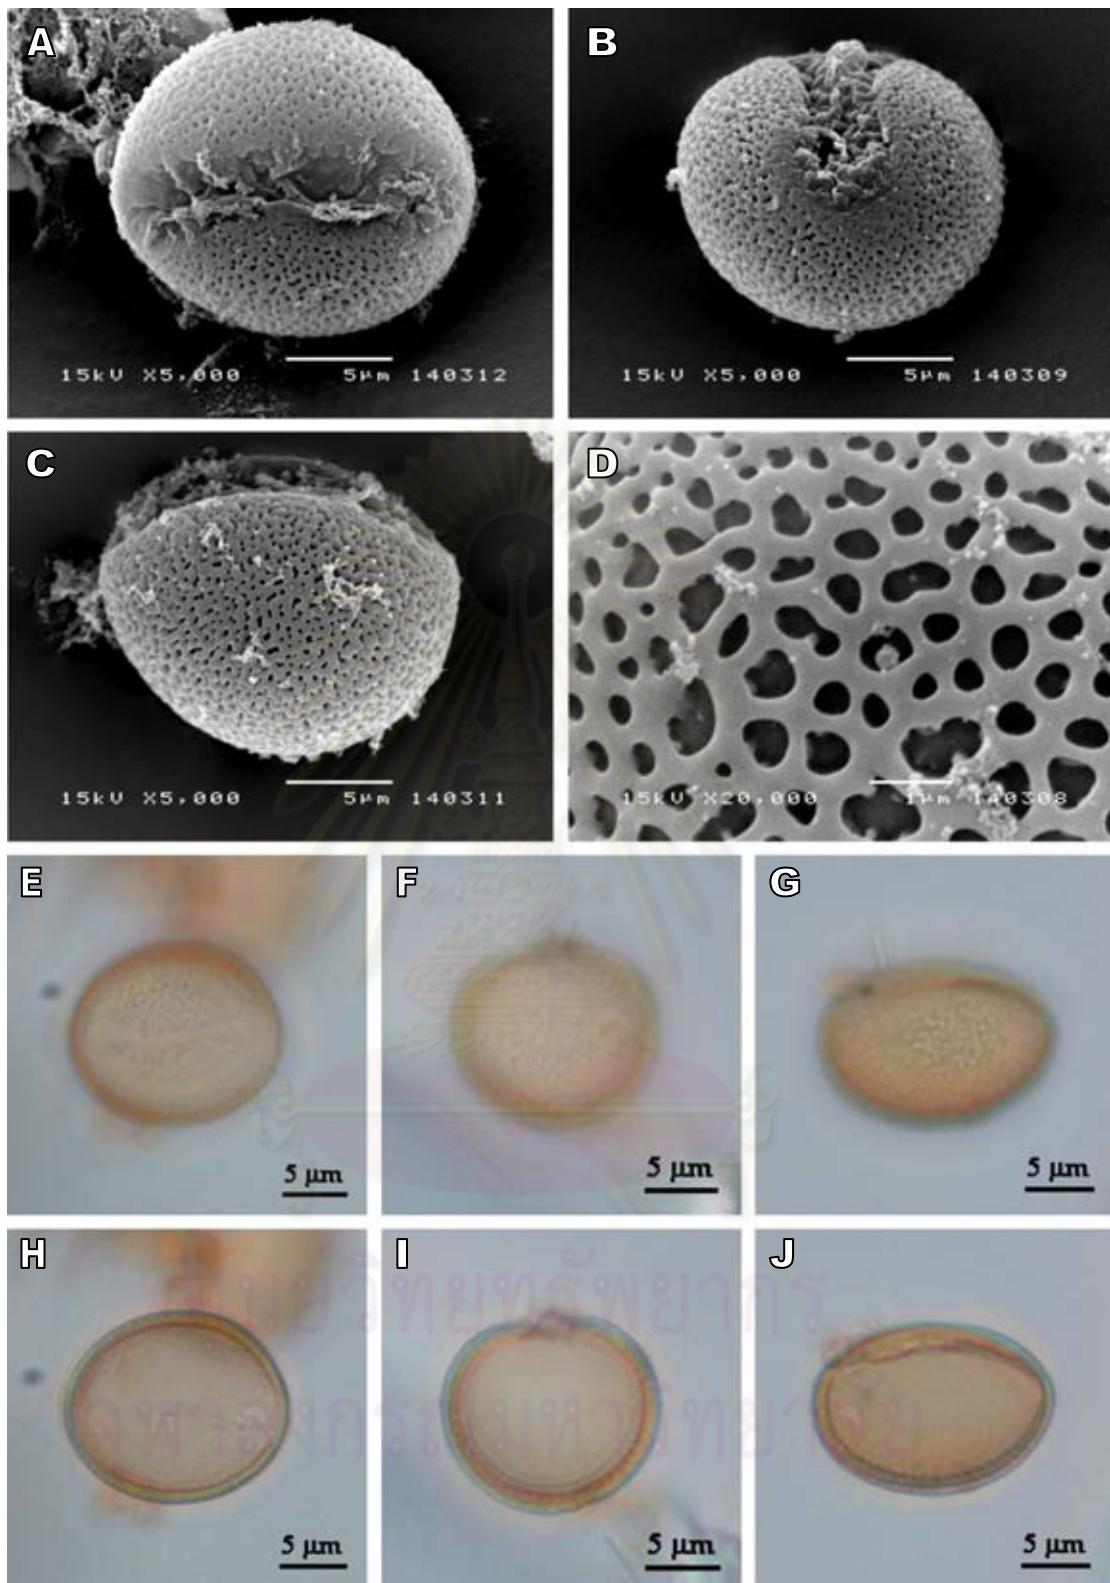

Plate 57 *Phoenix paludosa* Roxb.: (A) Polar view, (B) Shorter equatorial view, (C) Longer equatorial view, (D) Equatorial view, surface, (E) Polar view, colpus, (F) Shorter equatorial view, surface, (G) Longer equatorial view, surface, (H) Polar view, optical section, (I) Shorter equatorial view, optical section, (J) Longer equatorial view, optical section (A-D: SEM; E-J: LM).

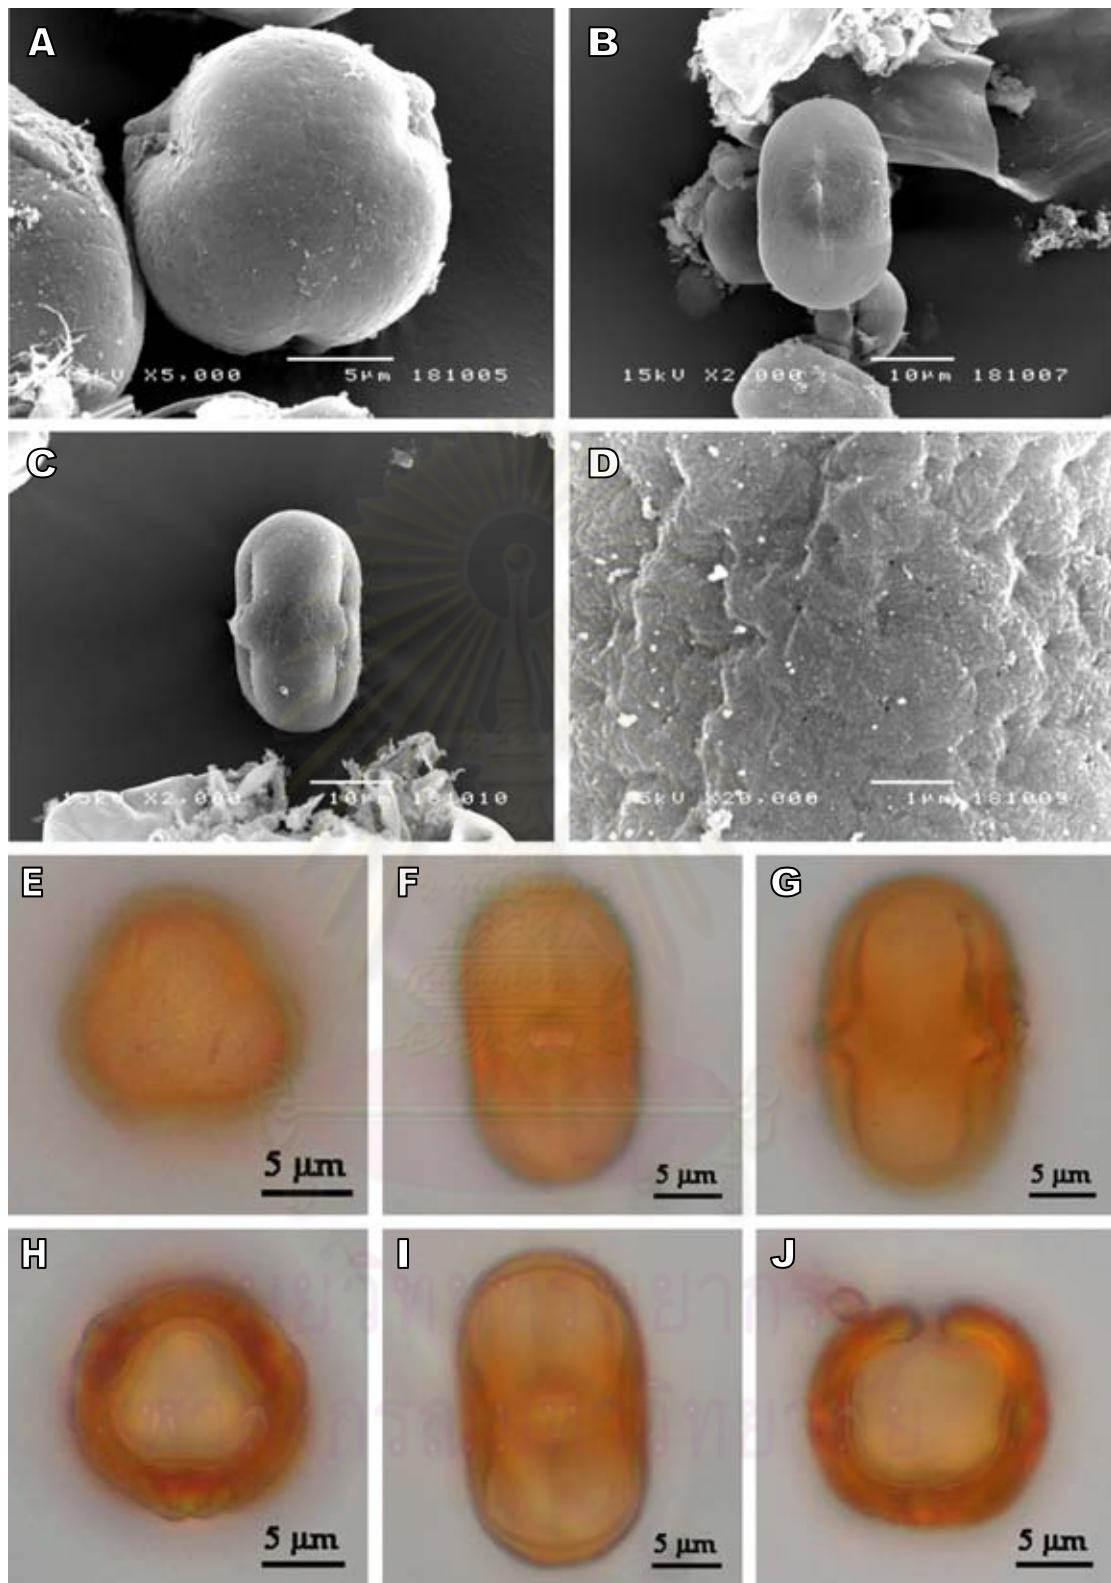

Plate 58 *Planchonella obovata* (R.Br.) Pierre: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view of 3-aperturate grain, optical section, (I) Optical section under colporus, (J) Polar view of 4-aperturate grain, optical section (A-D: SEM; E-J: LM).

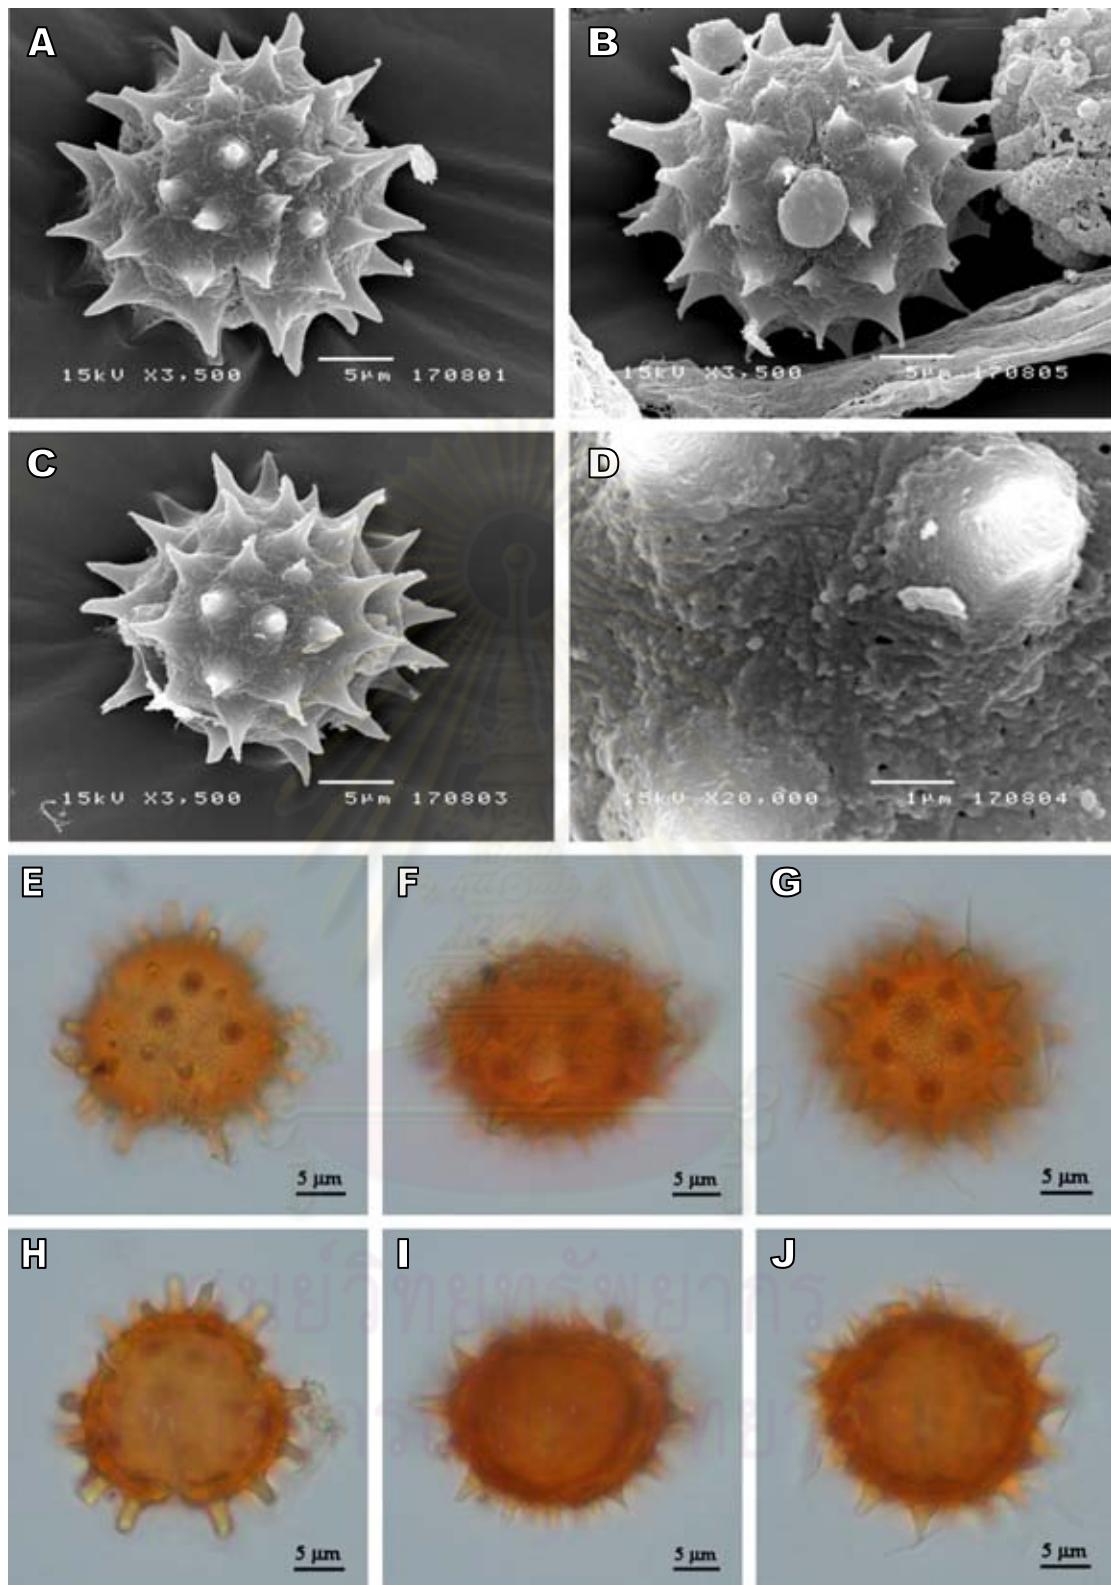

Plate 59 *Melanthera biflora* (L.) Wild: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

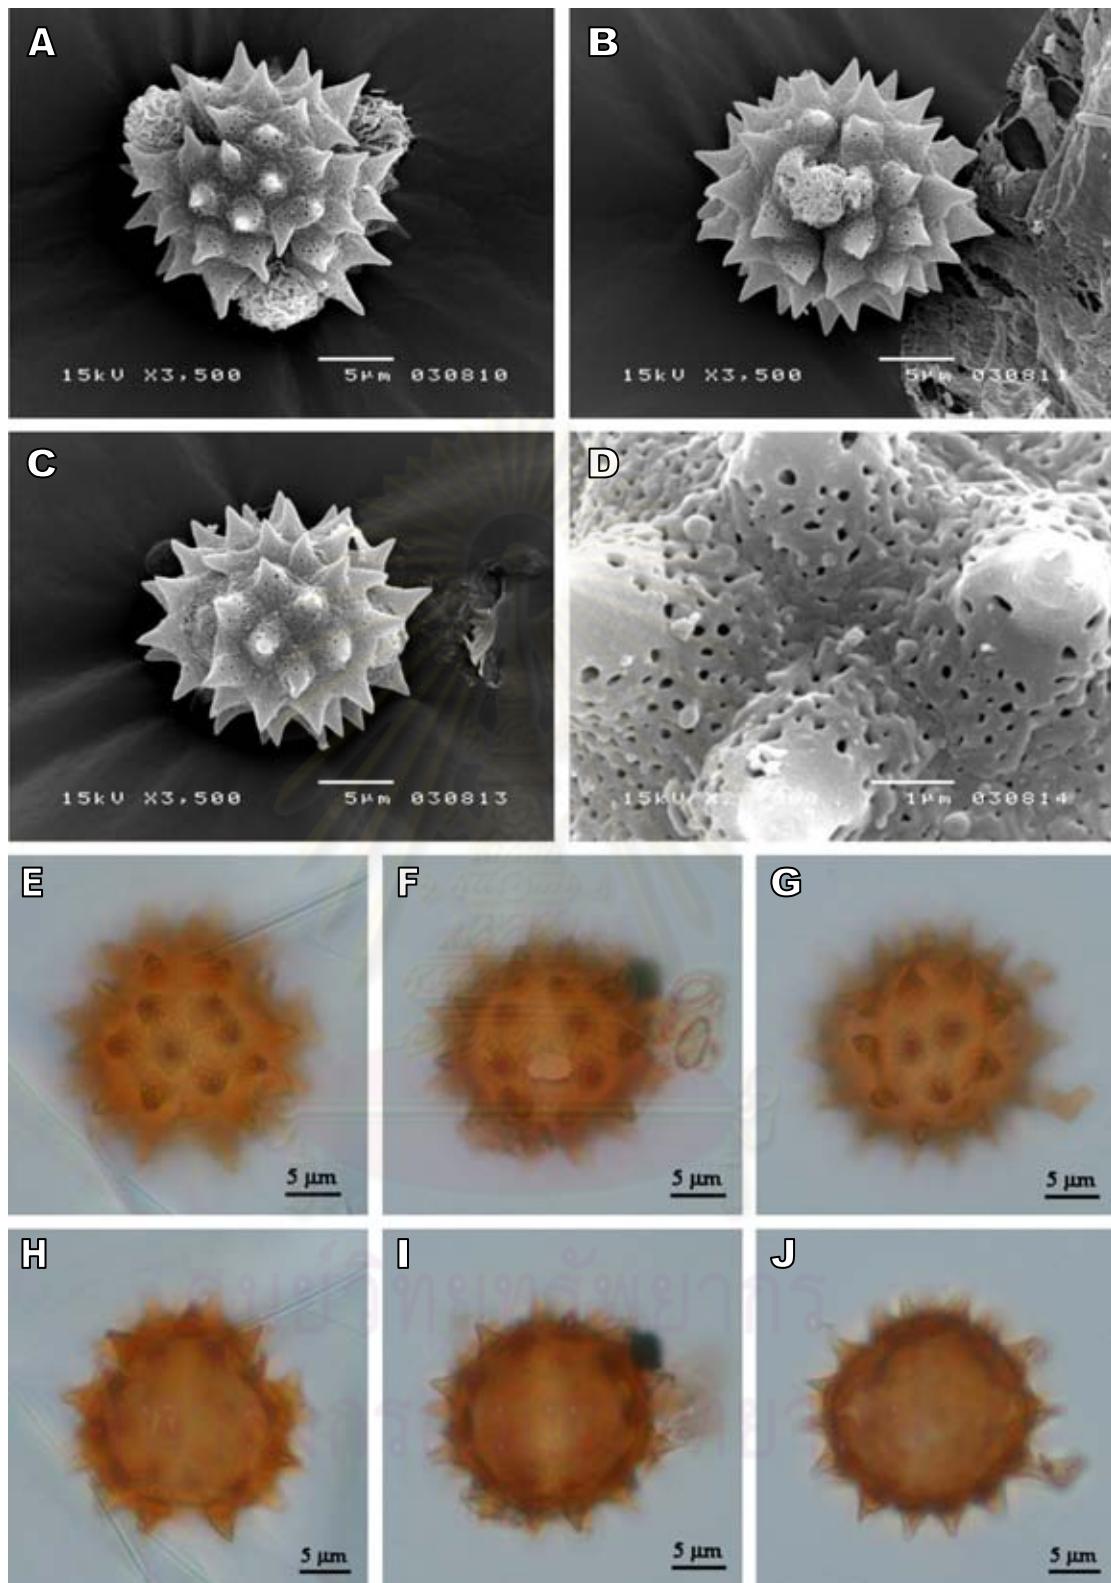

Plate 60 *Pluchea indica* (L.) Less.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

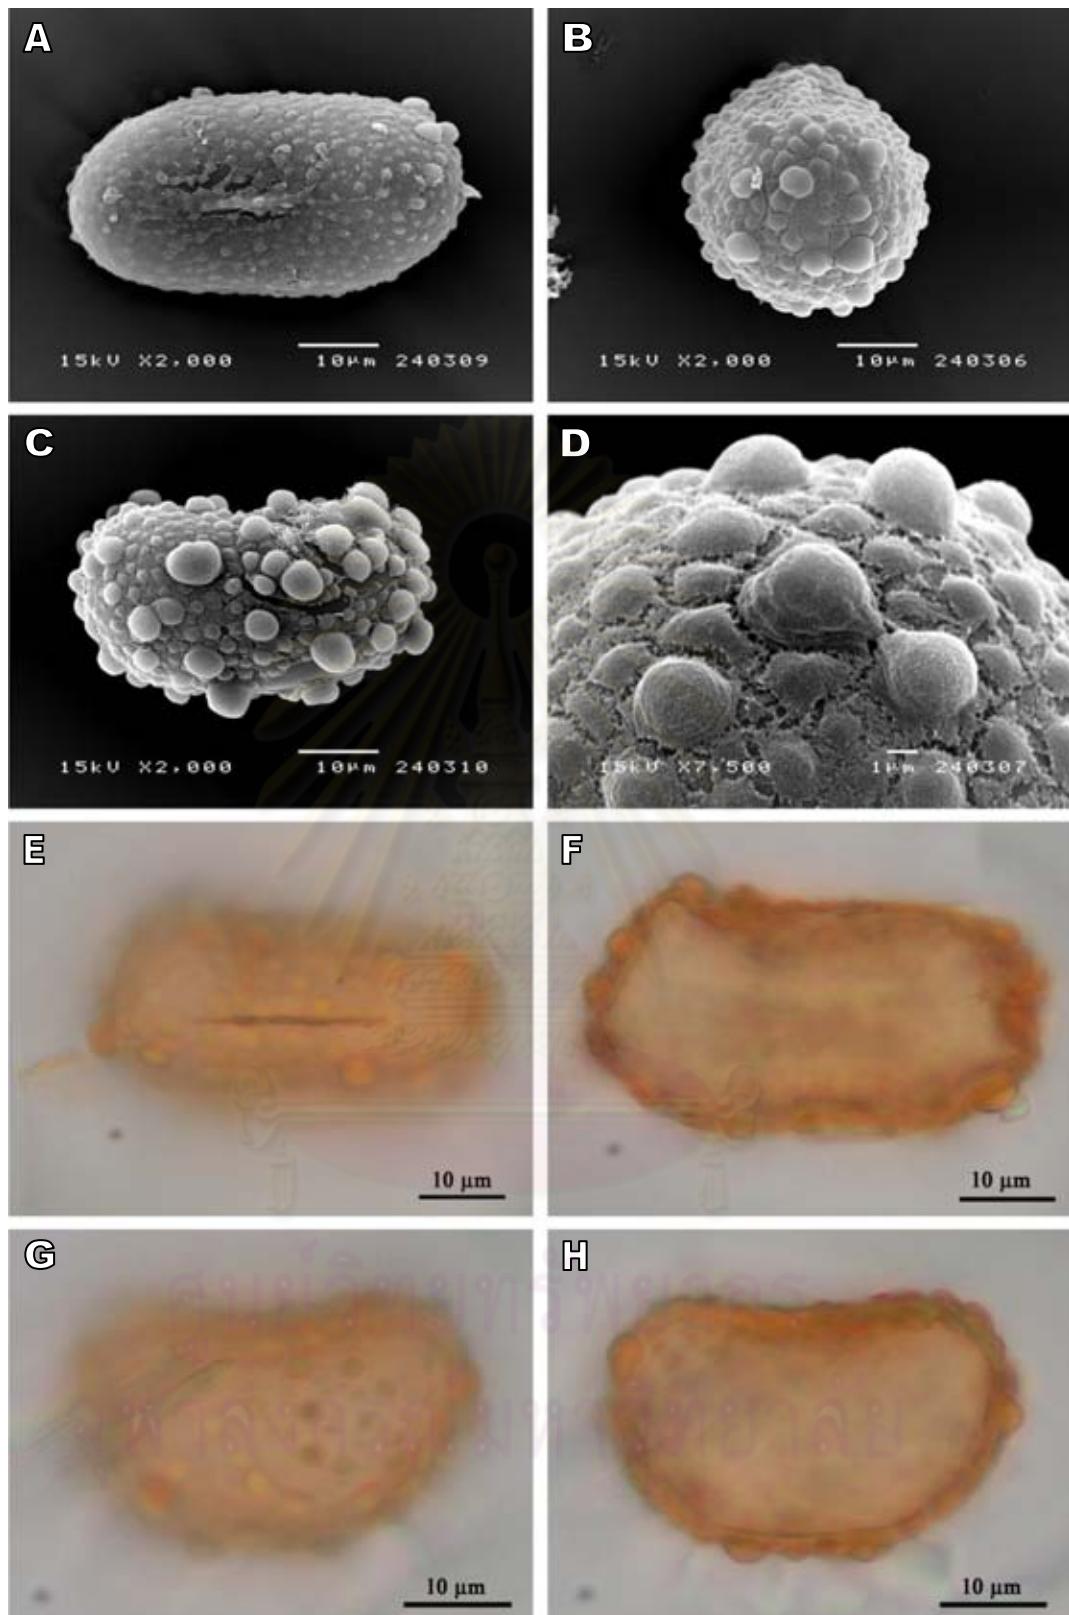

Plate 61 *Pyrrosia adnascens* (Sw.) Ching: (A) Polar view, laesura, (B) Shorter equatorial view, (C) Longer equatorial view, (D) Equatorial view, surface, (E) Polar view, laesura, (F) Polar view, optical section, (G) Longer equatorial view, surface, (H) Longer equatorial view, optical section (A-D: SEM; E-H: LM).

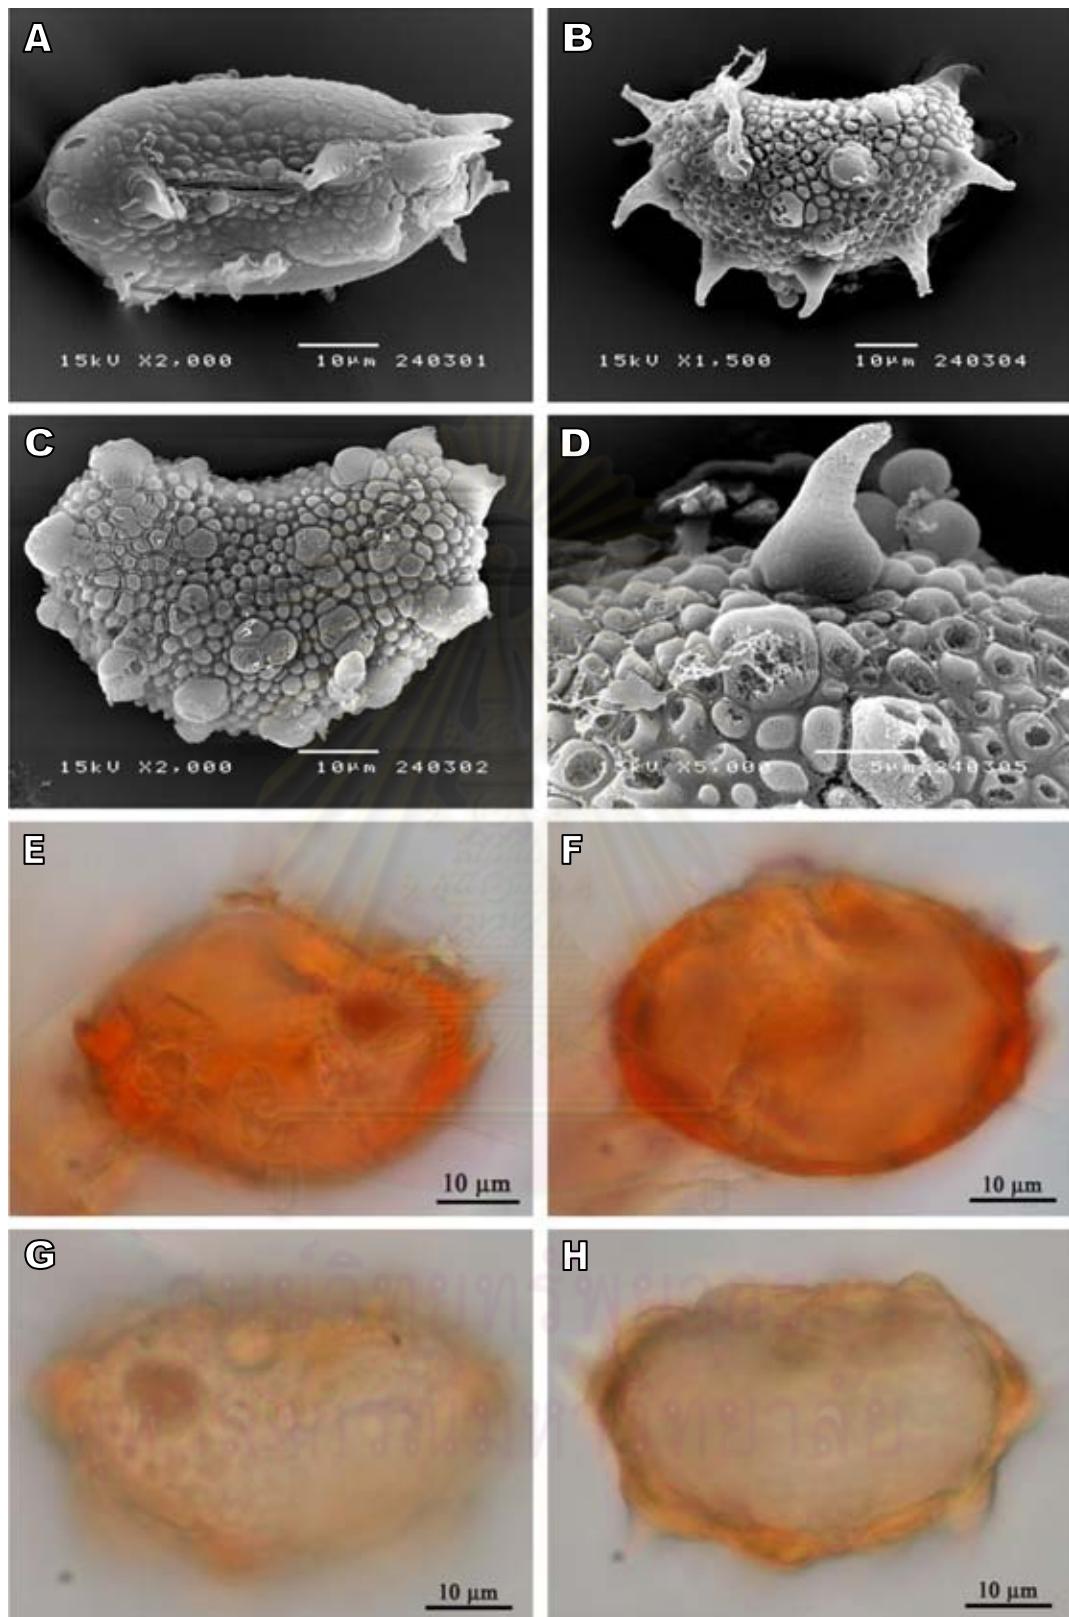

Plate 62 *Pyrrosia piloselloides* (L.) M.G. Price: (A) Polar view, laesura, (B) Longer equatorial view, echinate (C) Longer equatorial view, gemmate, (D) Equatorial view, surface, (E) Polar view, laesura, (F) Polar view, optical section, (G) Longer equatorial view, surface, (H) Longer equatorial view, optical section (A-D: SEM; E-H: LM).

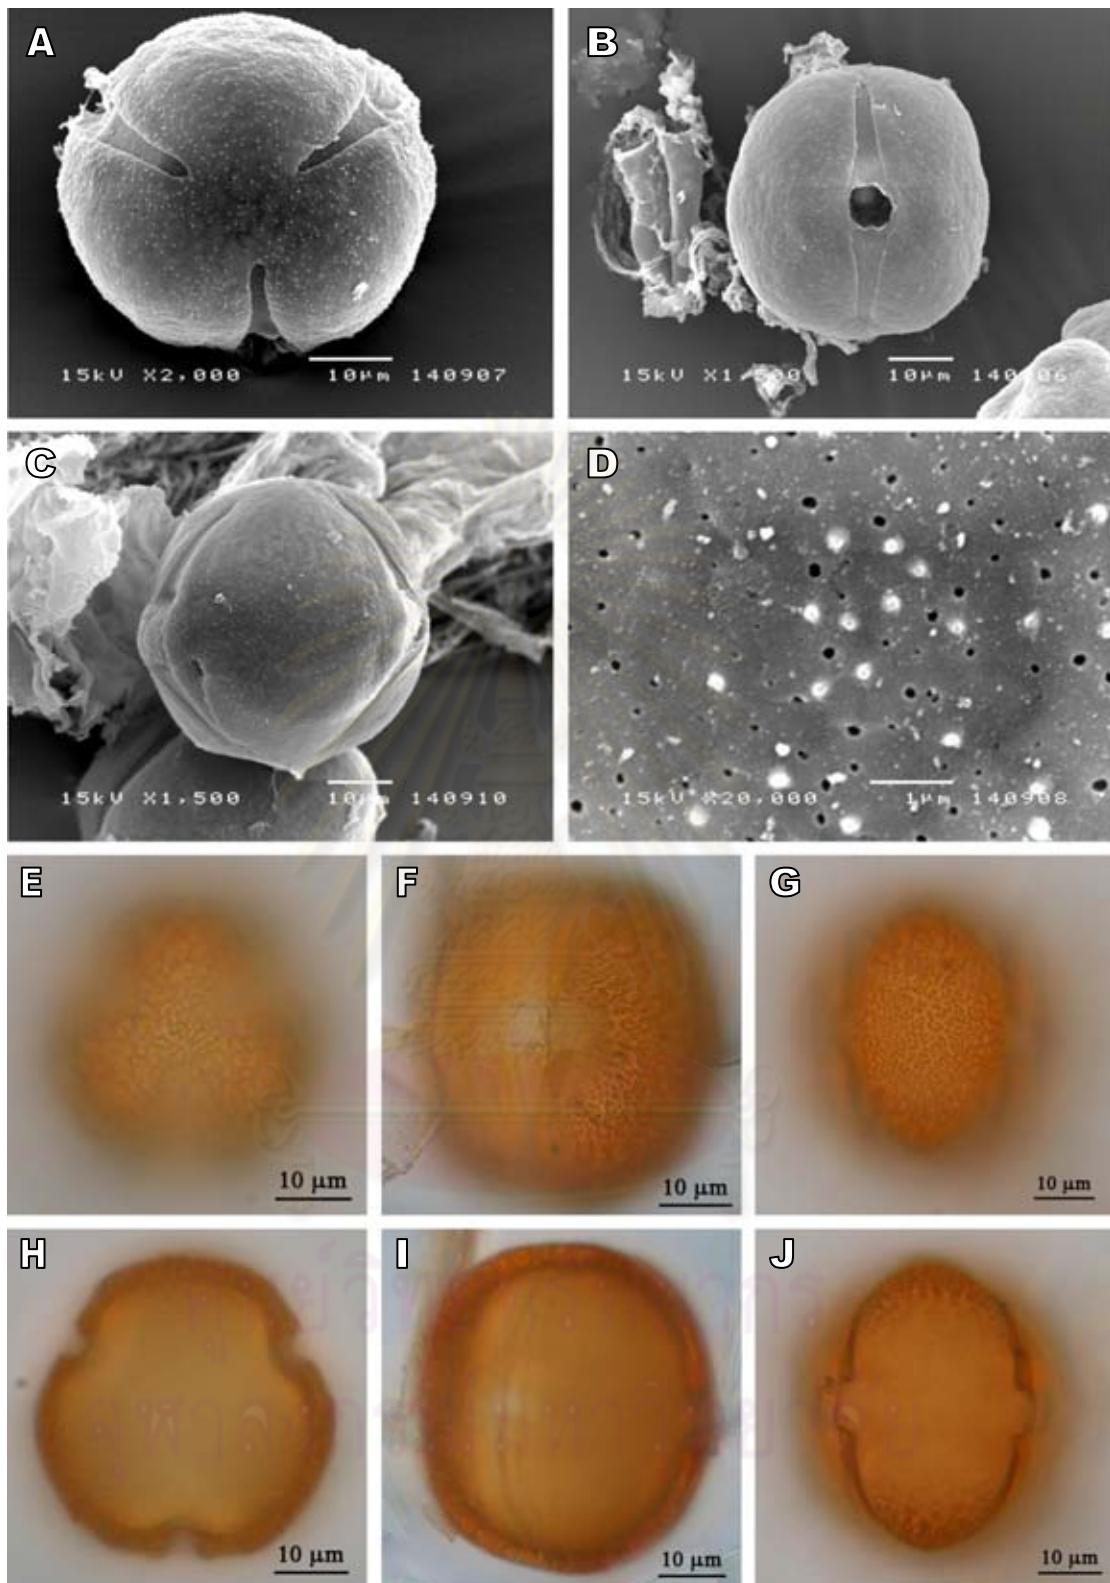

Plate 63 *Scaevola taccada* (Gaertn.) Roxb.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

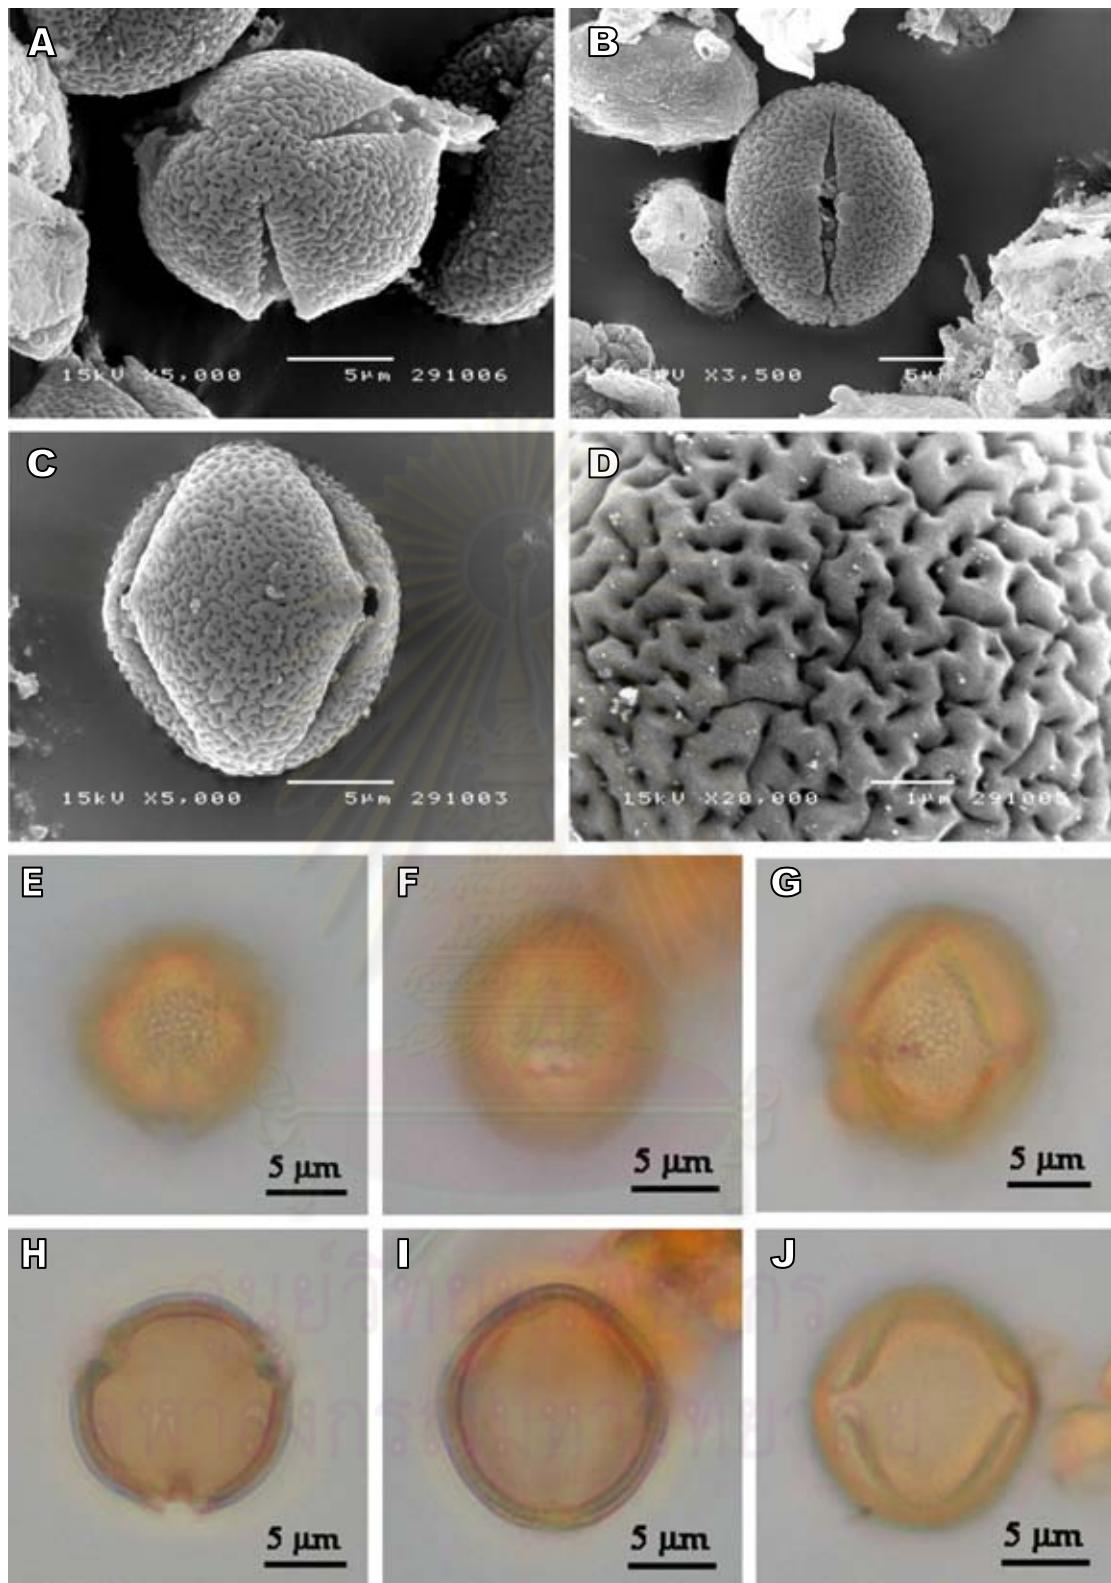

Plate 64 *Scolopia macrophylla* (W. & A.) Clos: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

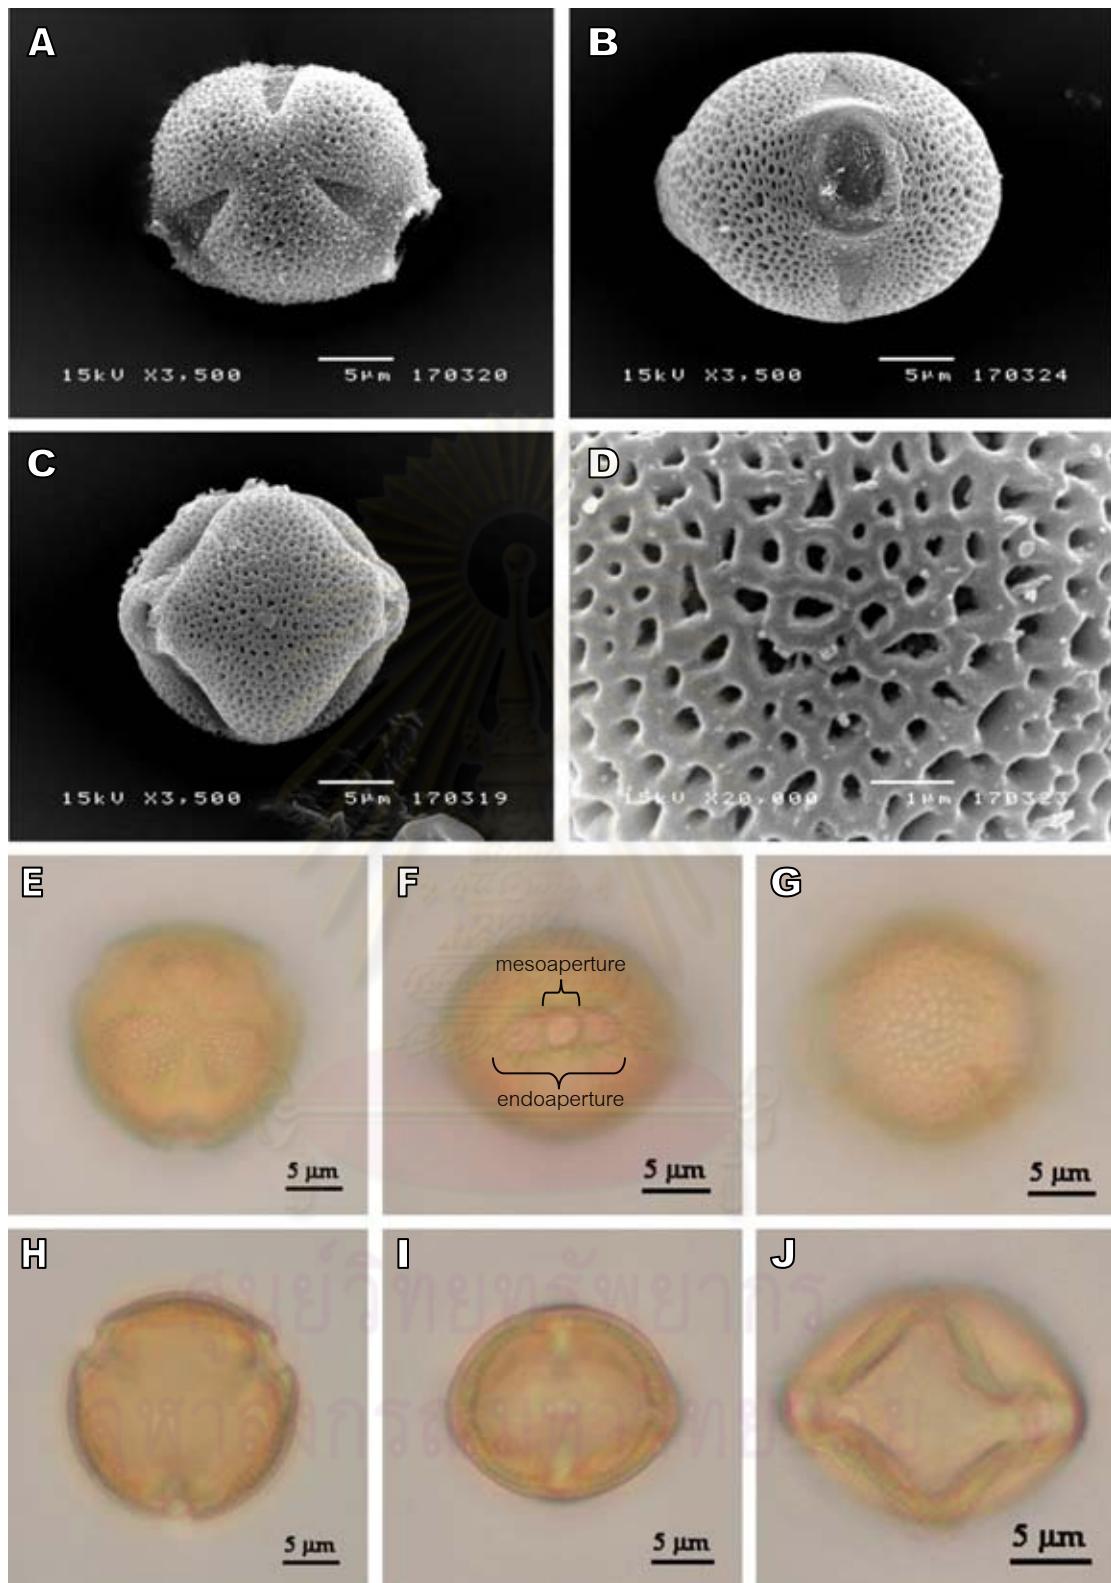

Plate 65 *Scyphiphora hydrophyllacea* C.F. Gaertn.: (A) Polar view, (B) Equatorial view, colpororus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, mesoaperture and endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colpororus, (J) Optical section under mesocolpium at costa ectocolpi (A-D: SEM; E-J: LM).

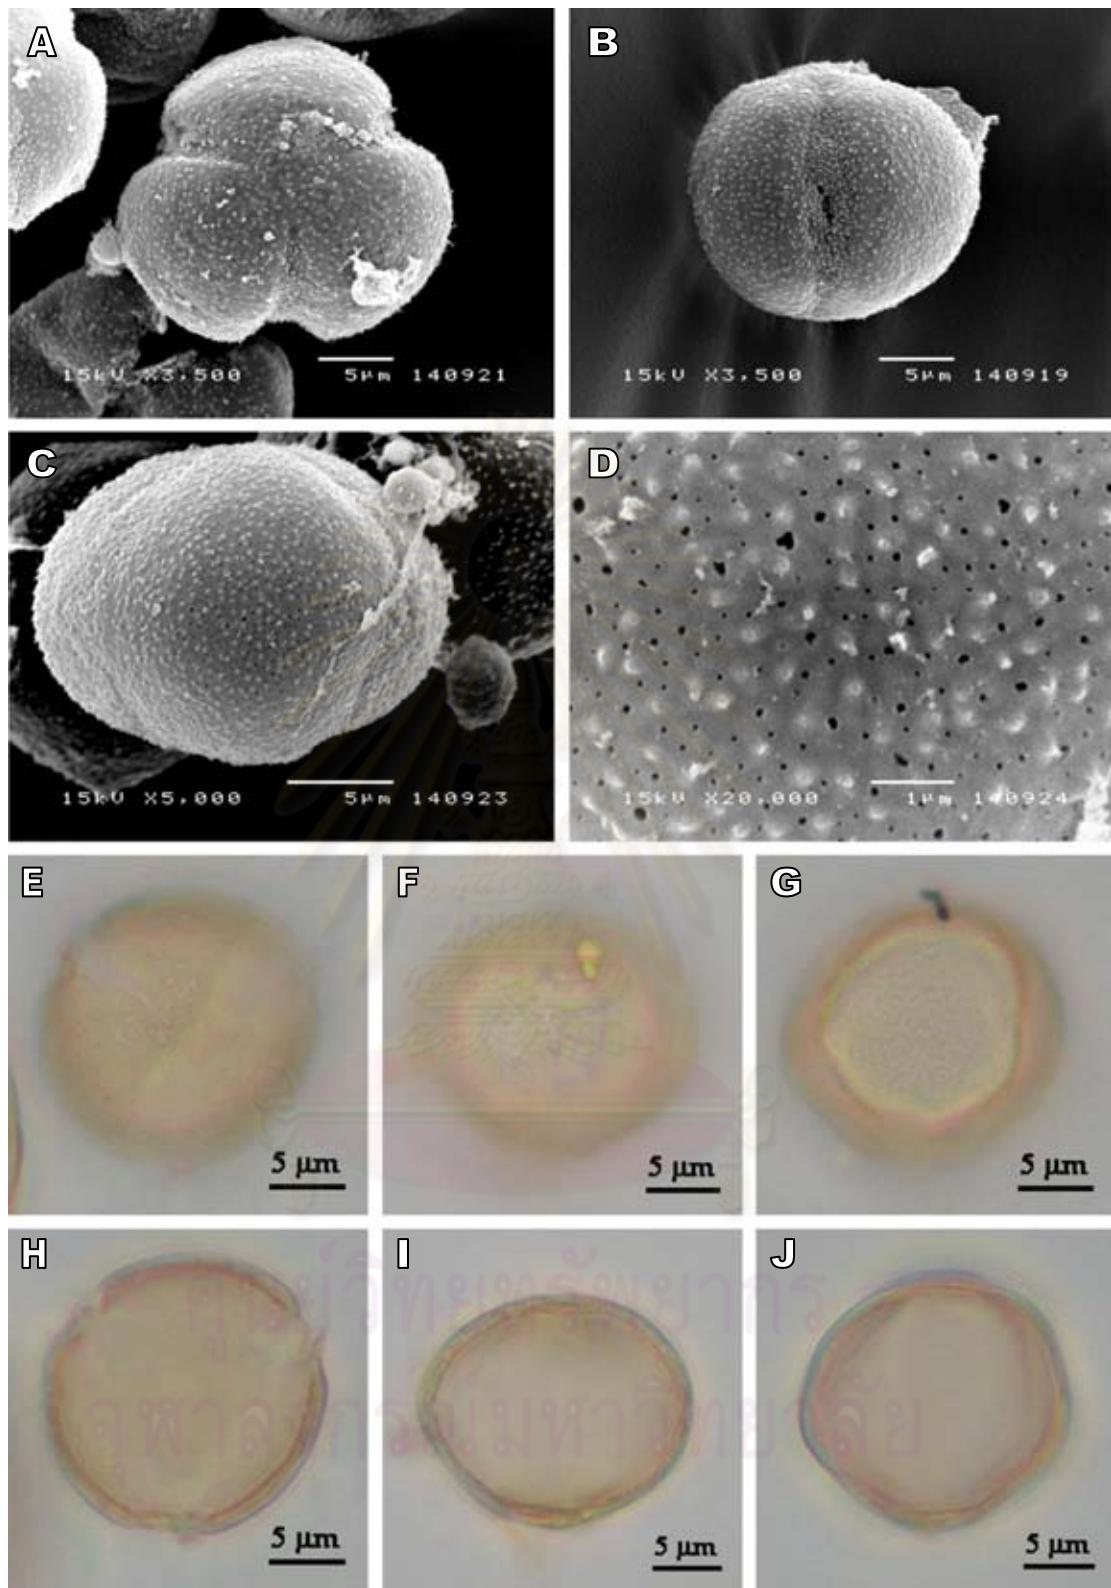

Plate 66 *Sesuvium portulacastrum* (L.): (A) Polar view, (B) Equatorial view, colpus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, colpus, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colpus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

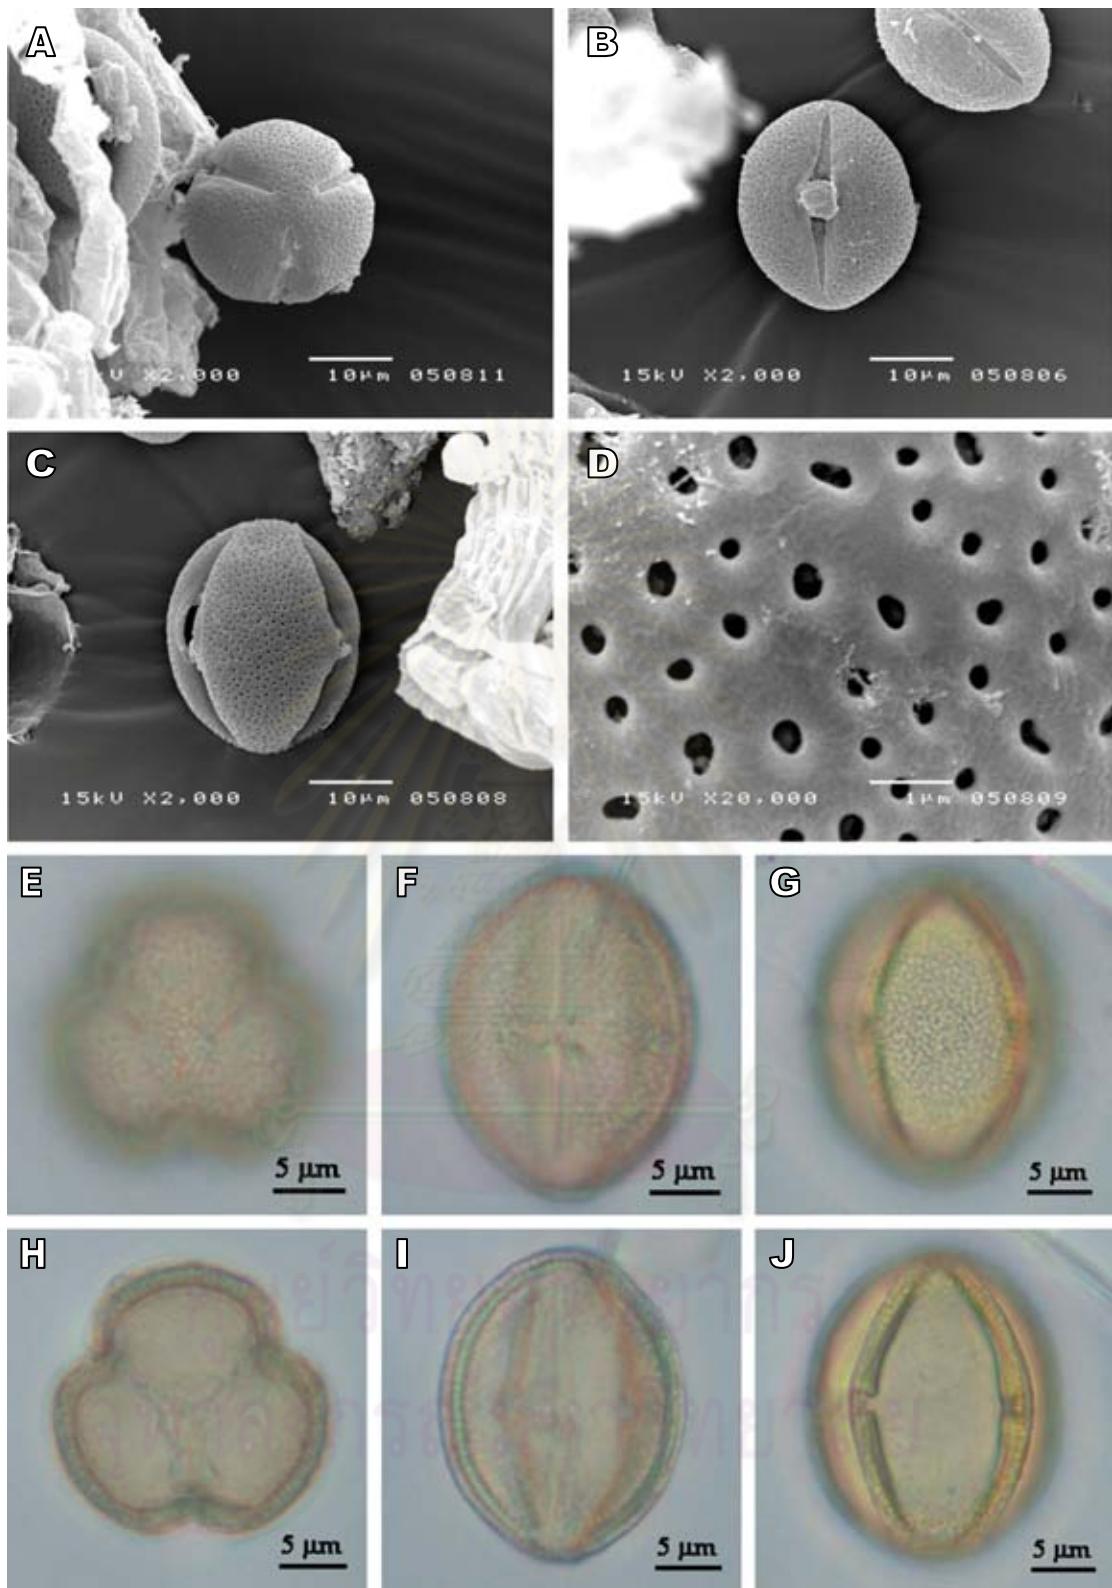

Plate 67 *Shirakiopsis indica* (Willd.) Esser: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium at costa ectocolpi and costa endopori (A-D: SEM; E-J: LM).

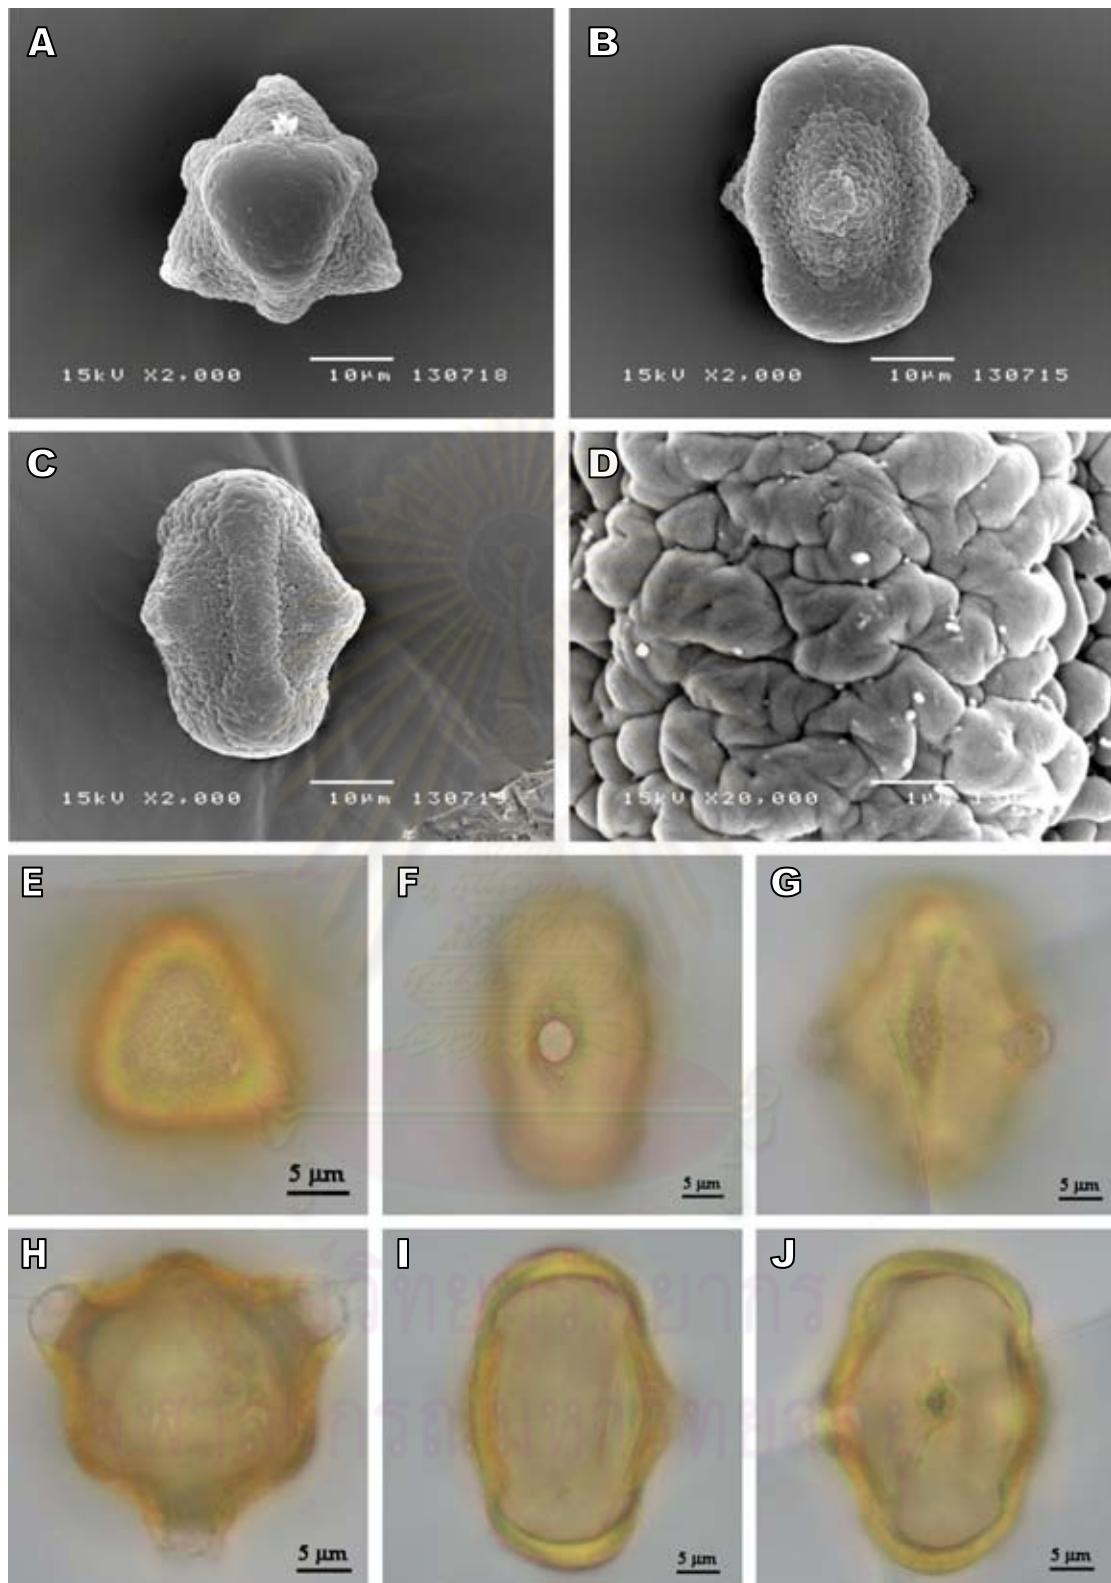

Plate 68 *Sonneratia alba* Sm.: (A) Polar view, (B) Equatorial view, porus, (C) Equatorial view, mesoporum, (D) Equatorial view, surface on ridge on mesoporum, (E) Polar view, surface, (F) Equatorial view, porus, (G) Equatorial view, mesoporum surface, (H) Polar view, optical section, (I) Optical section under porus, (J) Optical section under mesoporum (A-D: SEM; E-J: LM).

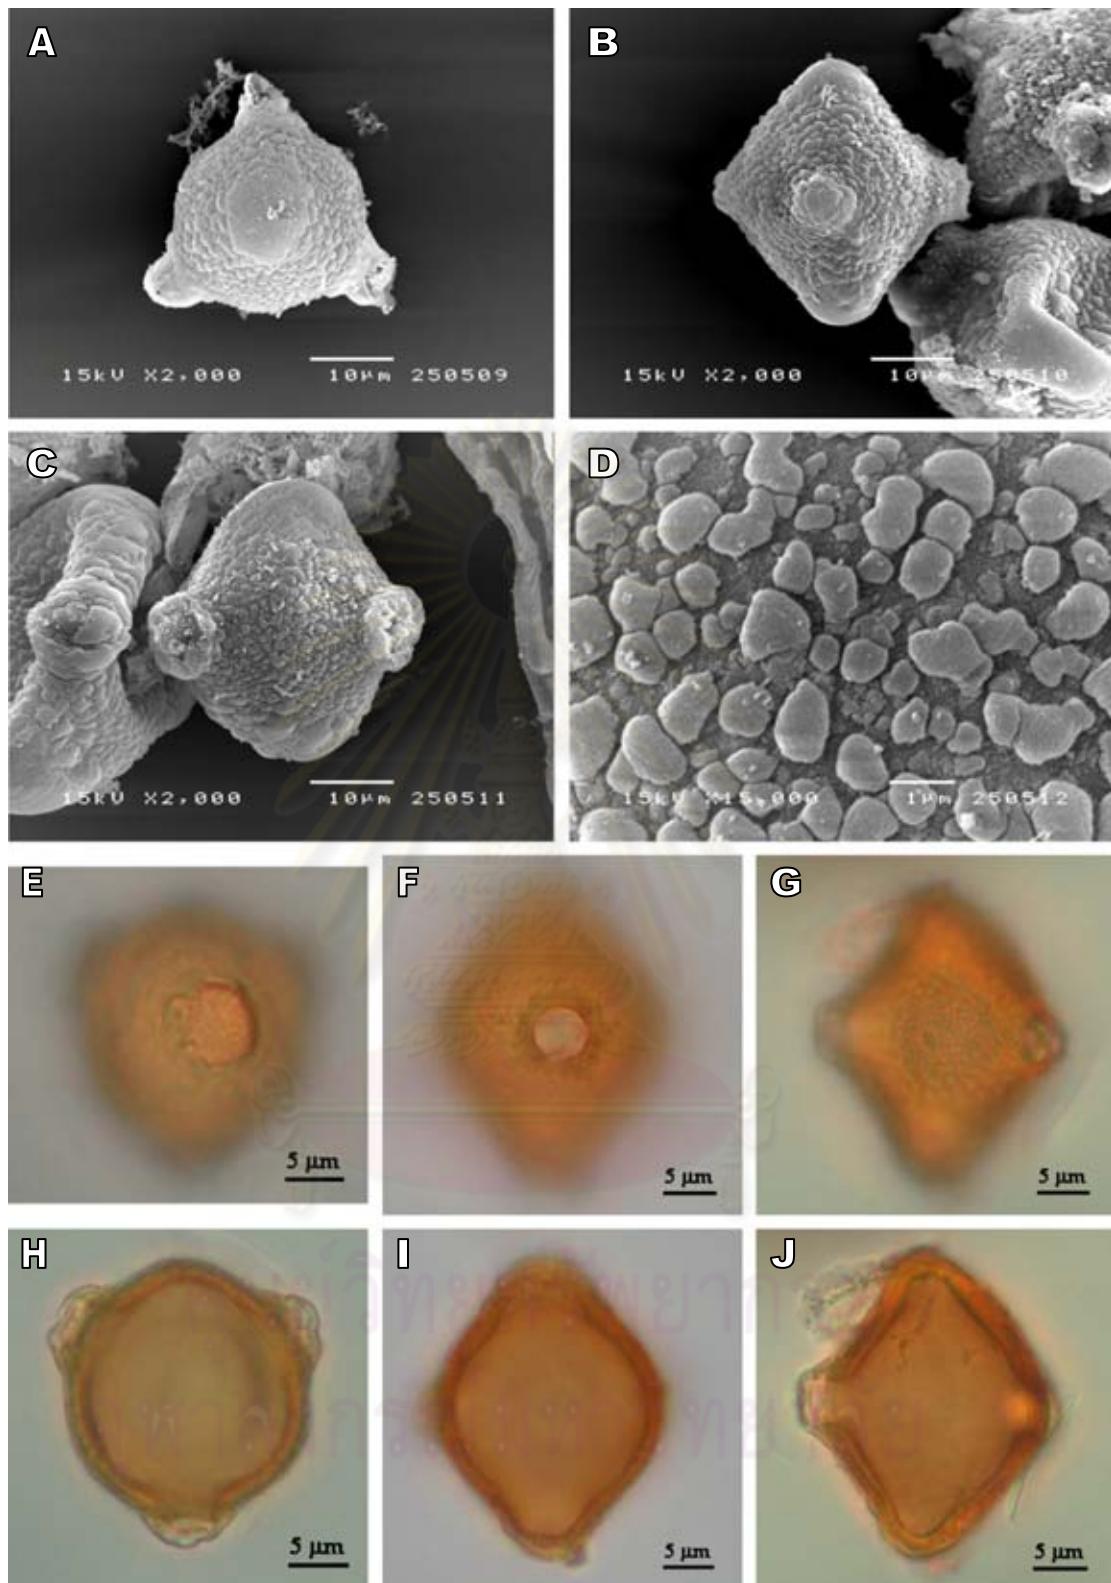

Plate 69 *Sonneratia caseolaris* (L.) Engl.: (A) Polar view, (B) Equatorial view, porus, (C) Equatorial view, mesoporum, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, porus, (G) Equatorial view, mesoporum surface, (H) Polar view, optical section, (I) Optical section under porus, (J) Optical section under mesoporum (A-D: SEM; E-J: LM).

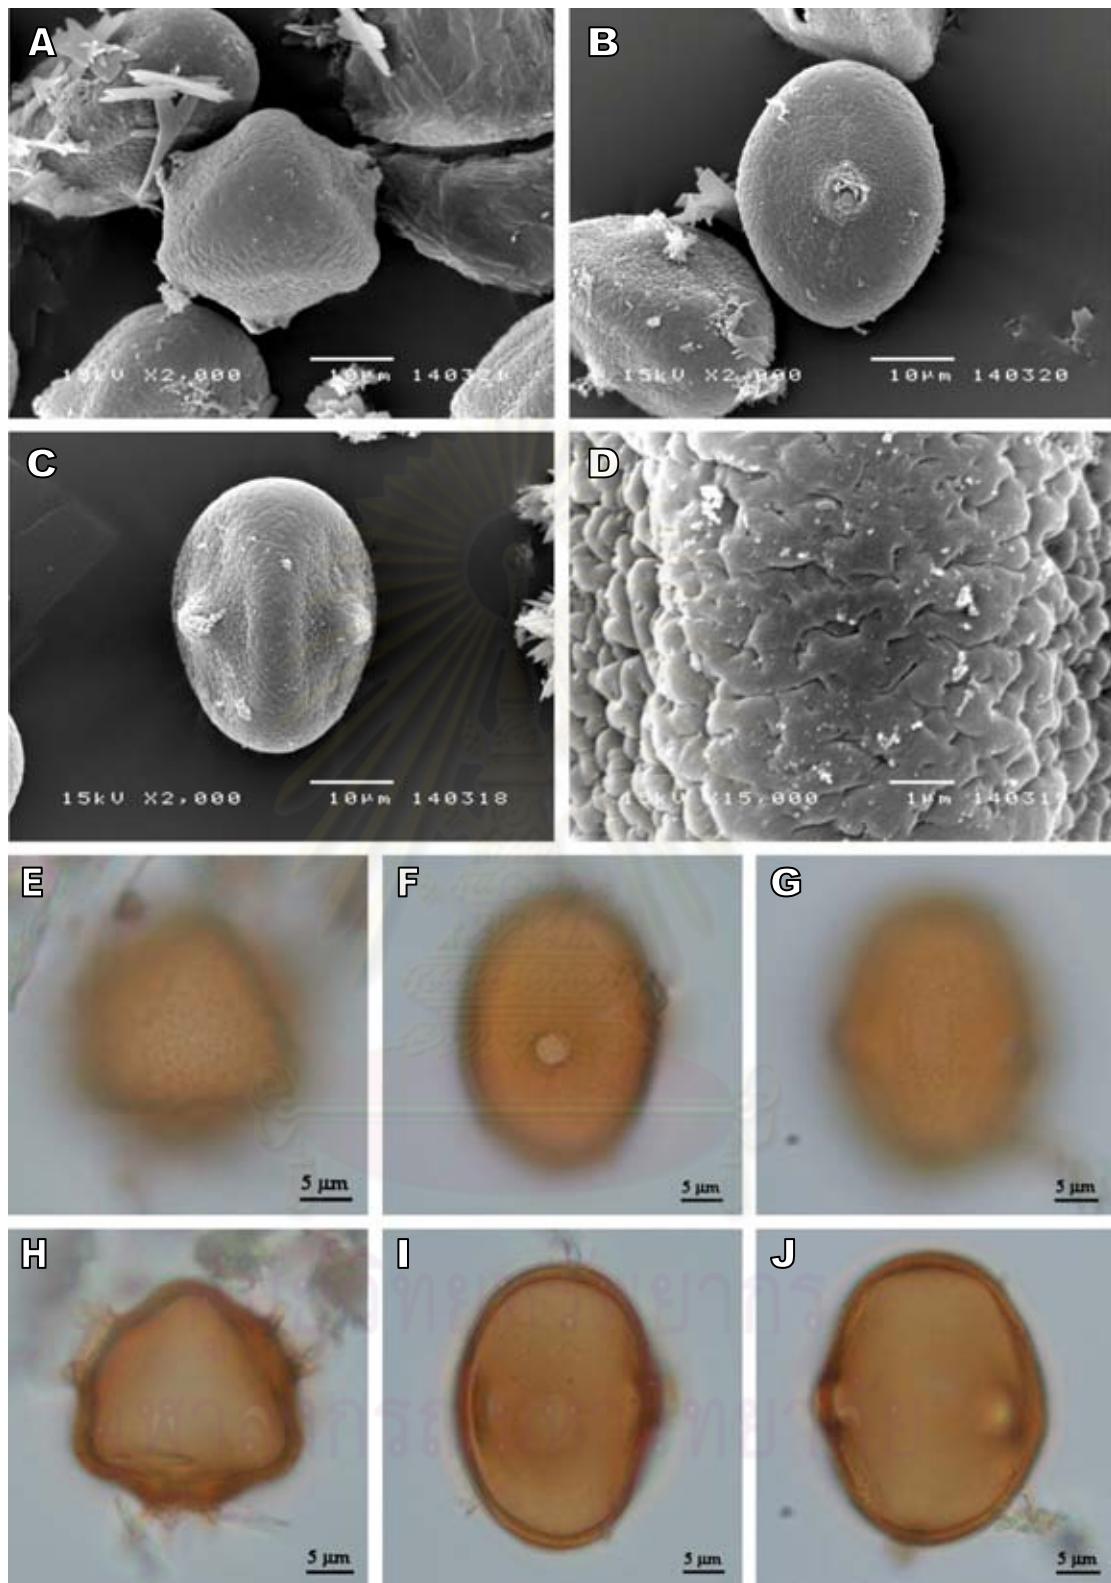

Plate 70 *Sonneratia griffithii* Kurz: (A) Polar view, (B) Equatorial view, porus, (C) Equatorial view, mesoporum, (D) Equatorial view, surface on ridge on mesoporum, (E) Polar view, surface, (F) Equatorial view, porus, (G) Equatorial view, mesoporum surface, (H) Polar view, optical section, (I) Optical section under porus, (J) Optical section under mesoporum (A-D: SEM; E-J: LM).

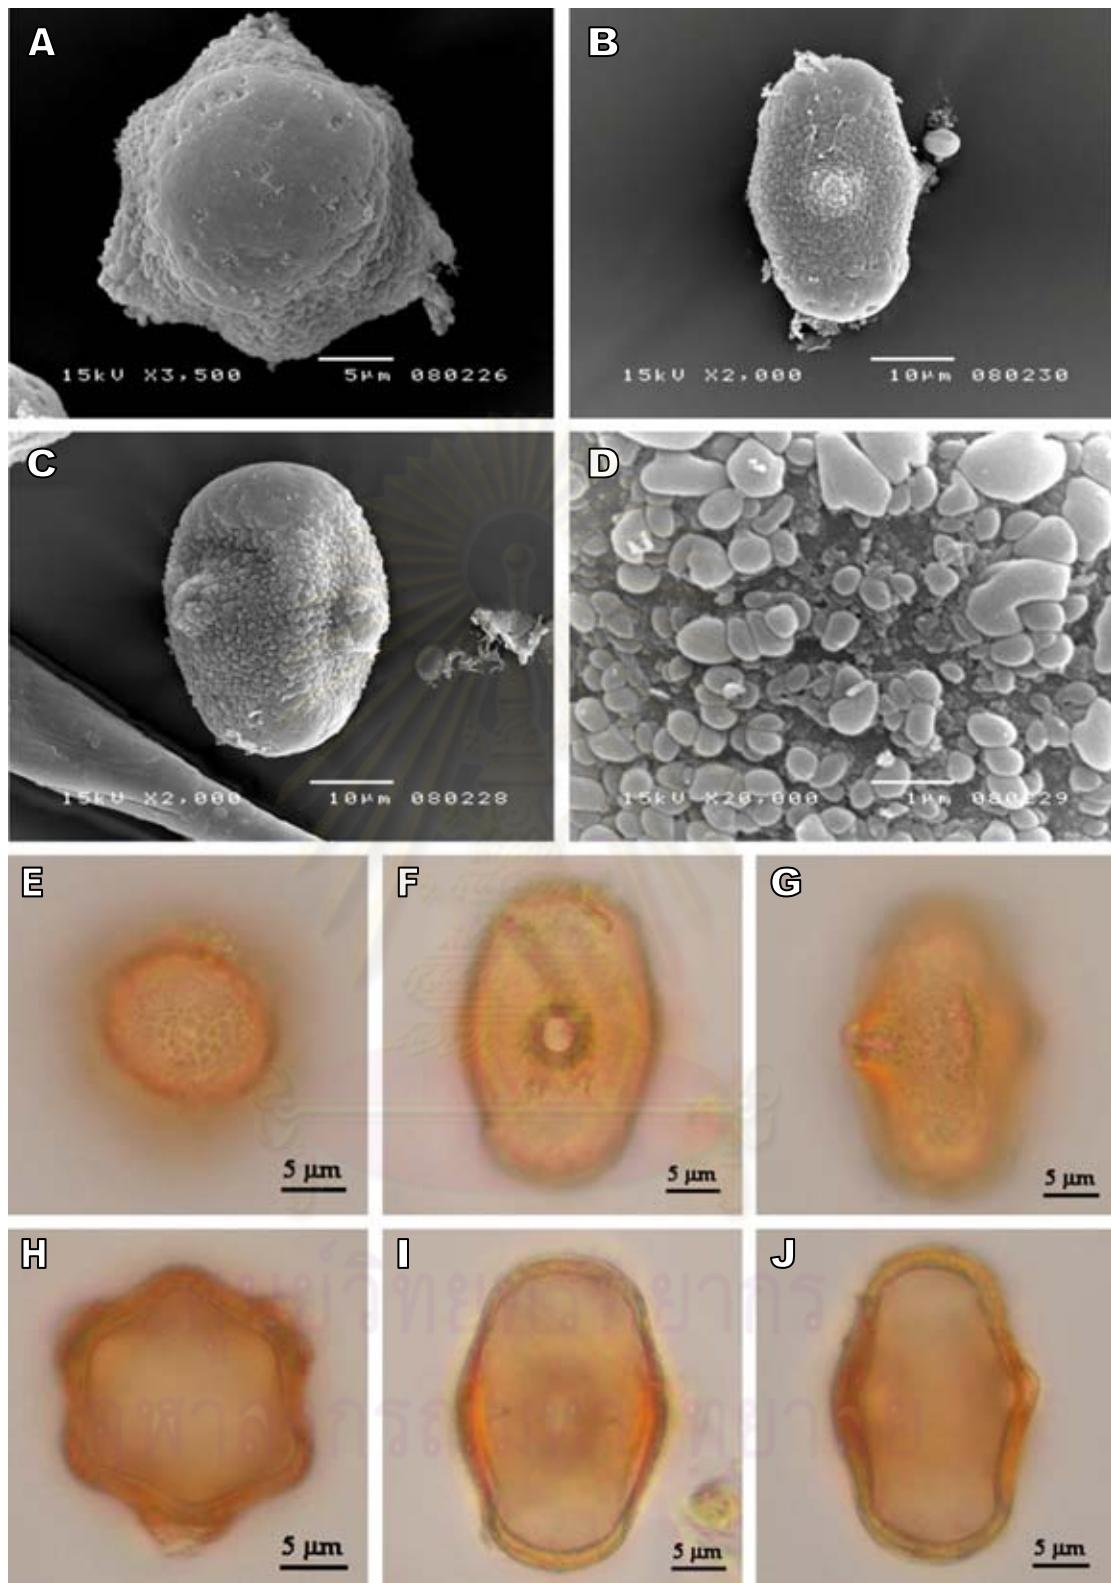

Plate 71 *Sonneratia ovata* Backer: (A) Polar view, (B) Equatorial view, porus, (C) Equatorial view, mesoporum, (D) Equatorial view, surface, (E) Polar view, surface, (F) Equatorial view, porus, (G) Equatorial view, mesoporum surface, (H) Polar view, optical section, (I) Optical section under porus, (J) Optical section under mesoporum (A-D: SEM; E-J: LM).

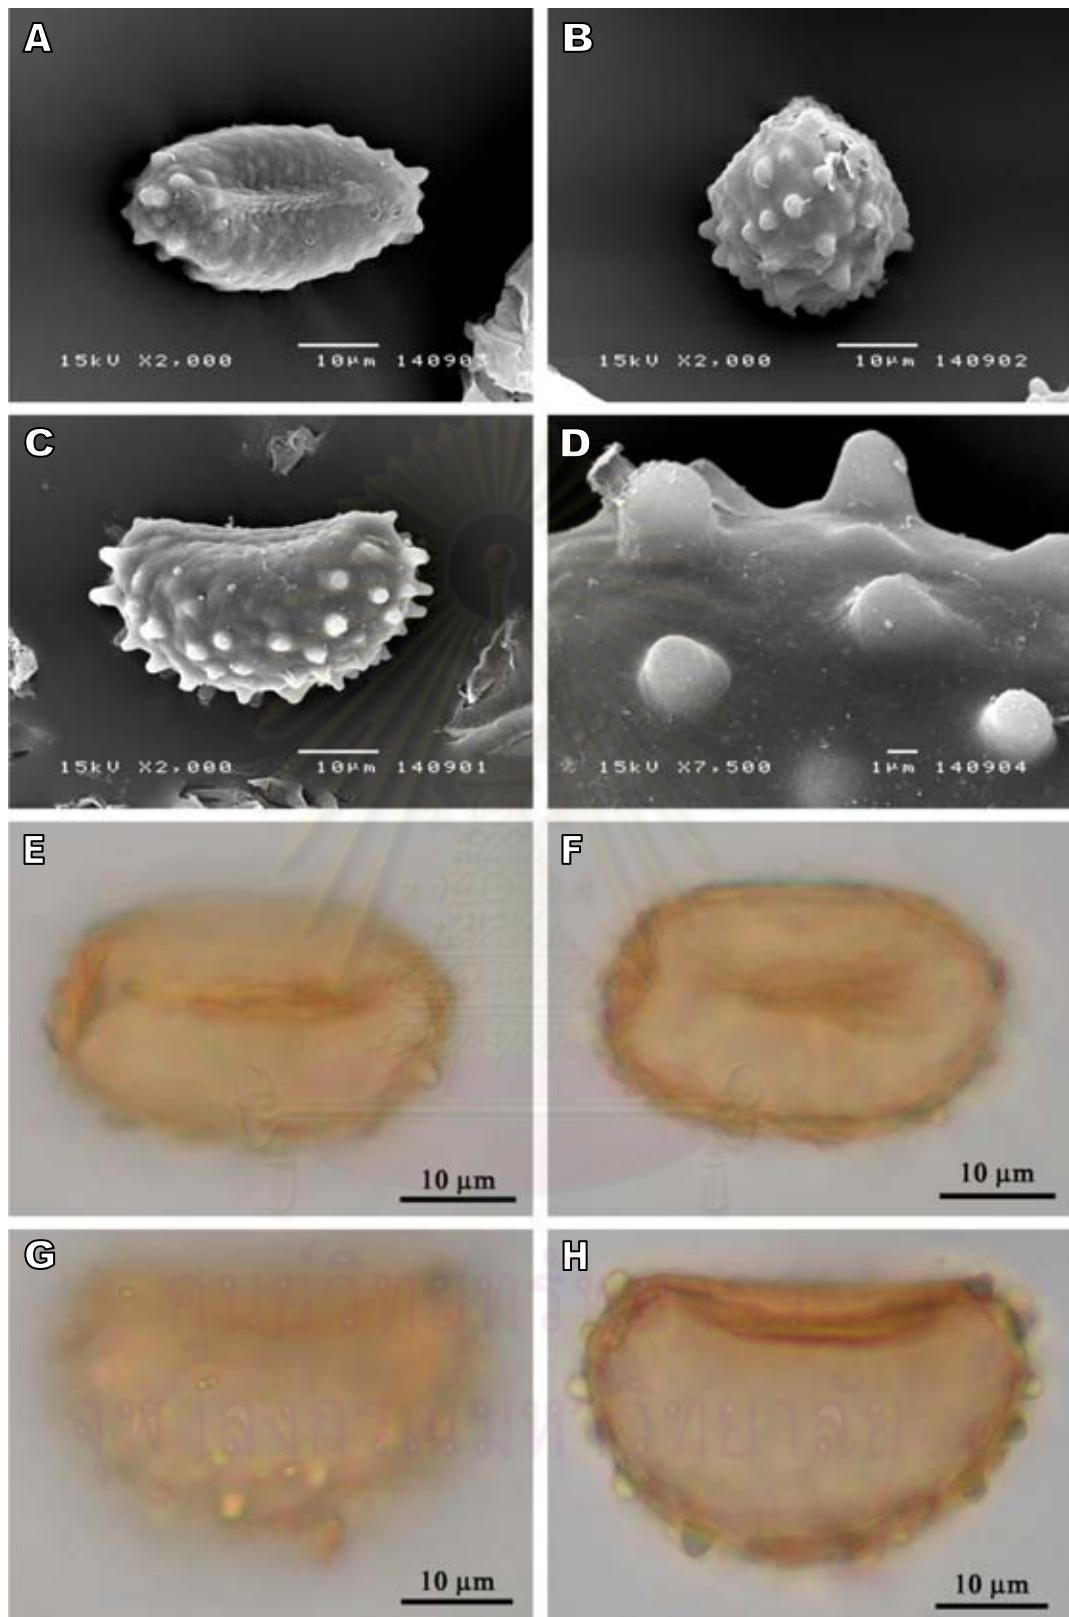

Plate 72 *Stenochlaena palustris* (Burm. f.) Bedd. : (A) Polar view, laesura, (B) Shorter equatorial view, (C) Longer equatorial view, (D) Equatorial view, surface, (E) Polar view, laesura, (F) Polar view, optical section, (G) Longer equatorial view, surface, (H) Longer equatorial view, optical section (A-D: SEM; E-H: LM).

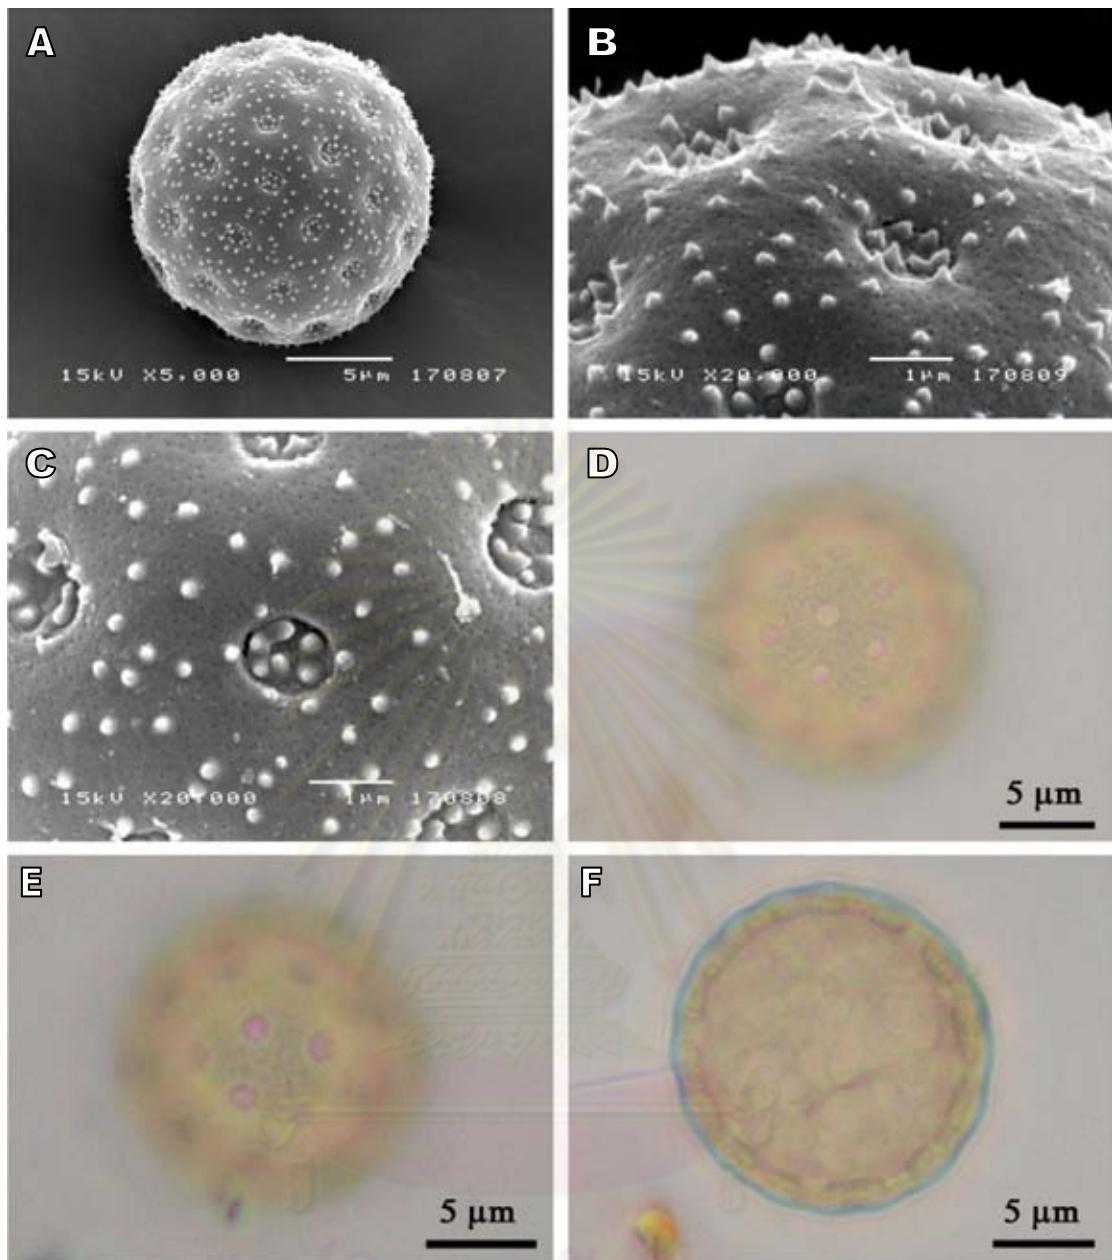

Plate 73 *Suaeda maritima* (L.) Dumort.: (A) Whole grain, polypantopori, (B) Surface, microechinate-perforate, (C) Operculum, microechinate, (D) Pori, (E) Surface, granulate, (F) Optical section, columella distinct (A-C: SEM; D-F: LM).

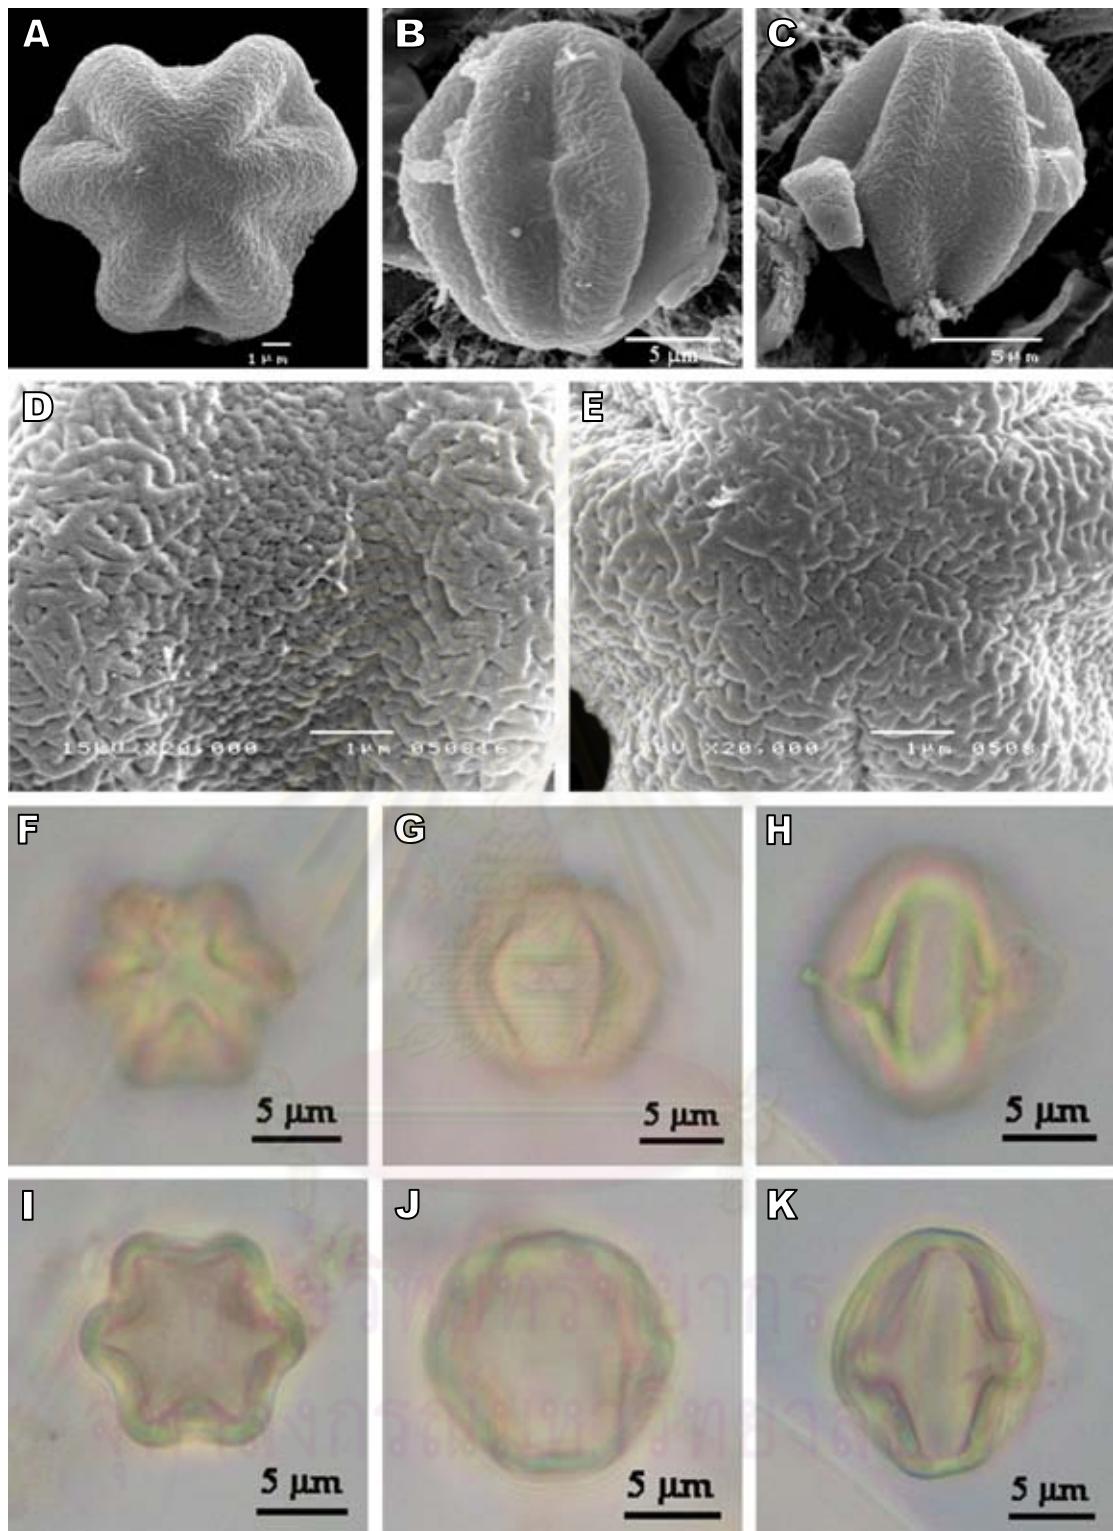

Plate 74 *Terminalia catappa* L.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, pseudocolpus, (D) Equatorial view, pseudocolpus surface, (E) Polar view, surface, (F) Polar view, surface, (G) Equatorial view, endoaperture, (H) Equatorial view, pseudocolpus surface, (I) Polar view, optical section, (J) Optical section under colporus, (K) Optical section under pseudocolpus (A-E: SEM; F-K: LM).

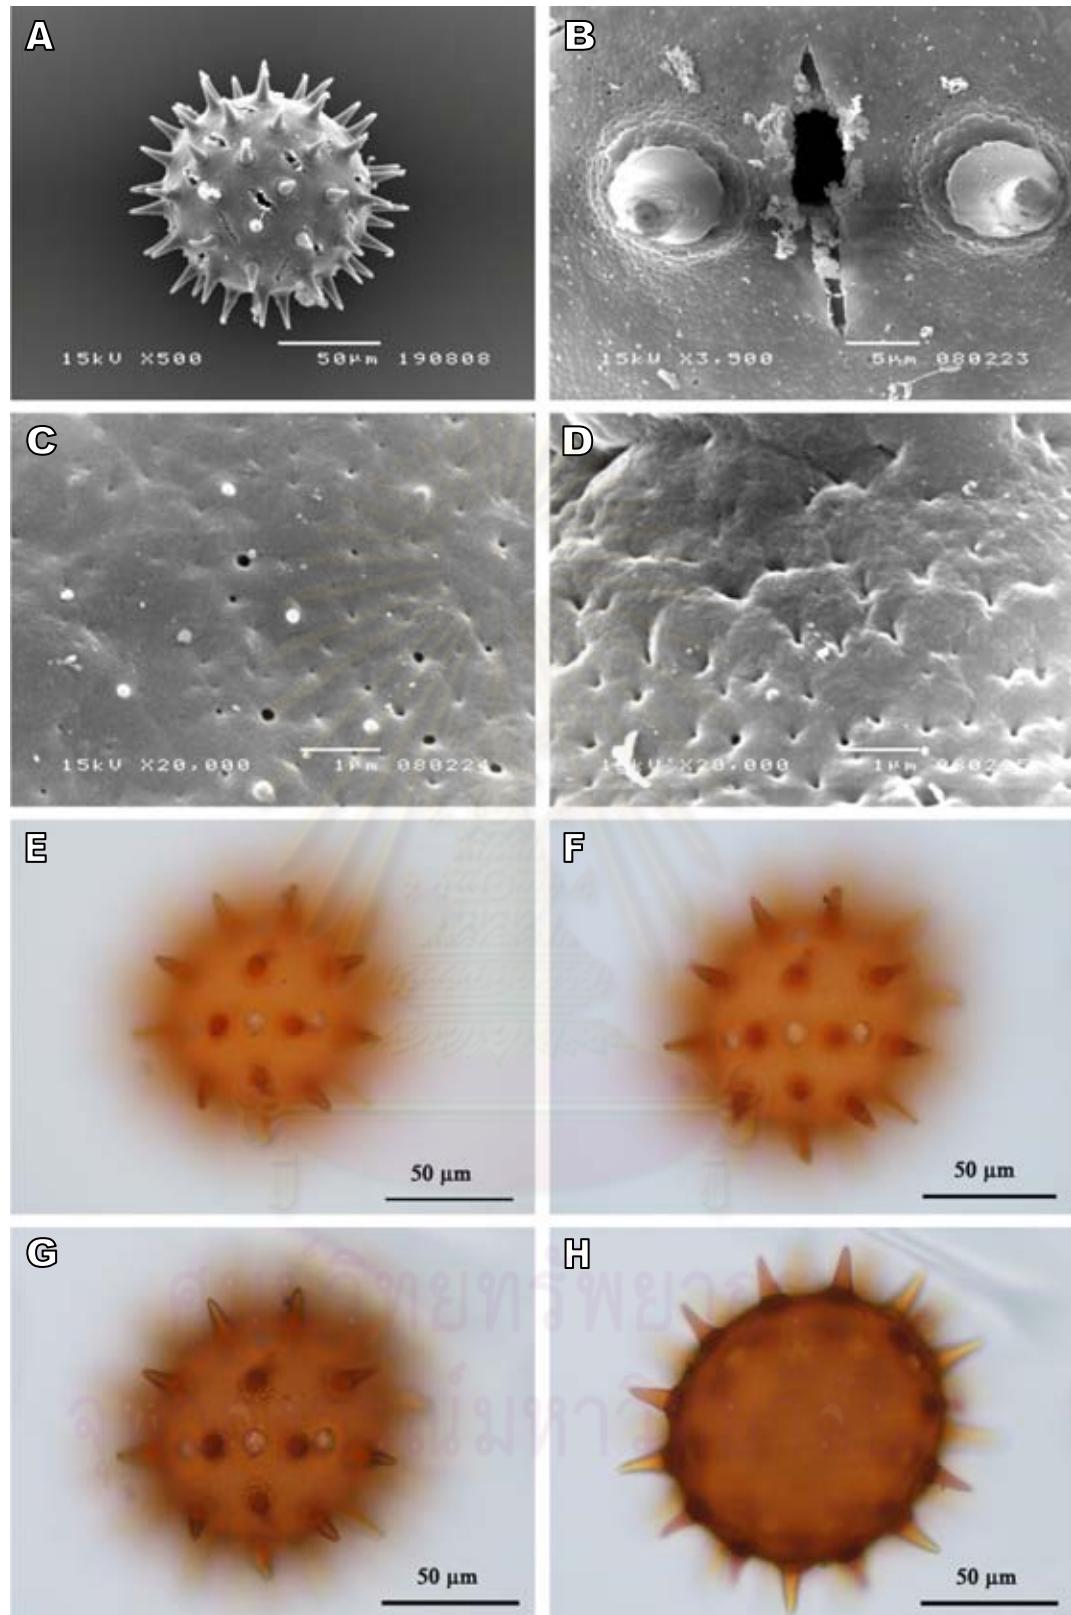

Plate 75 *Hibiscus tiliaceus* L.: (A) Whole grain, echinate, (B) Colporous, (C) Perforation and granulation on interspinal area, (D) Perforation on cushion, (E) Ecotocolpus, (F) Endoporus, (G) columellae under tectum at interspinal area and cushion, (H) Optical section (A-D: SEM; E-H: LM).

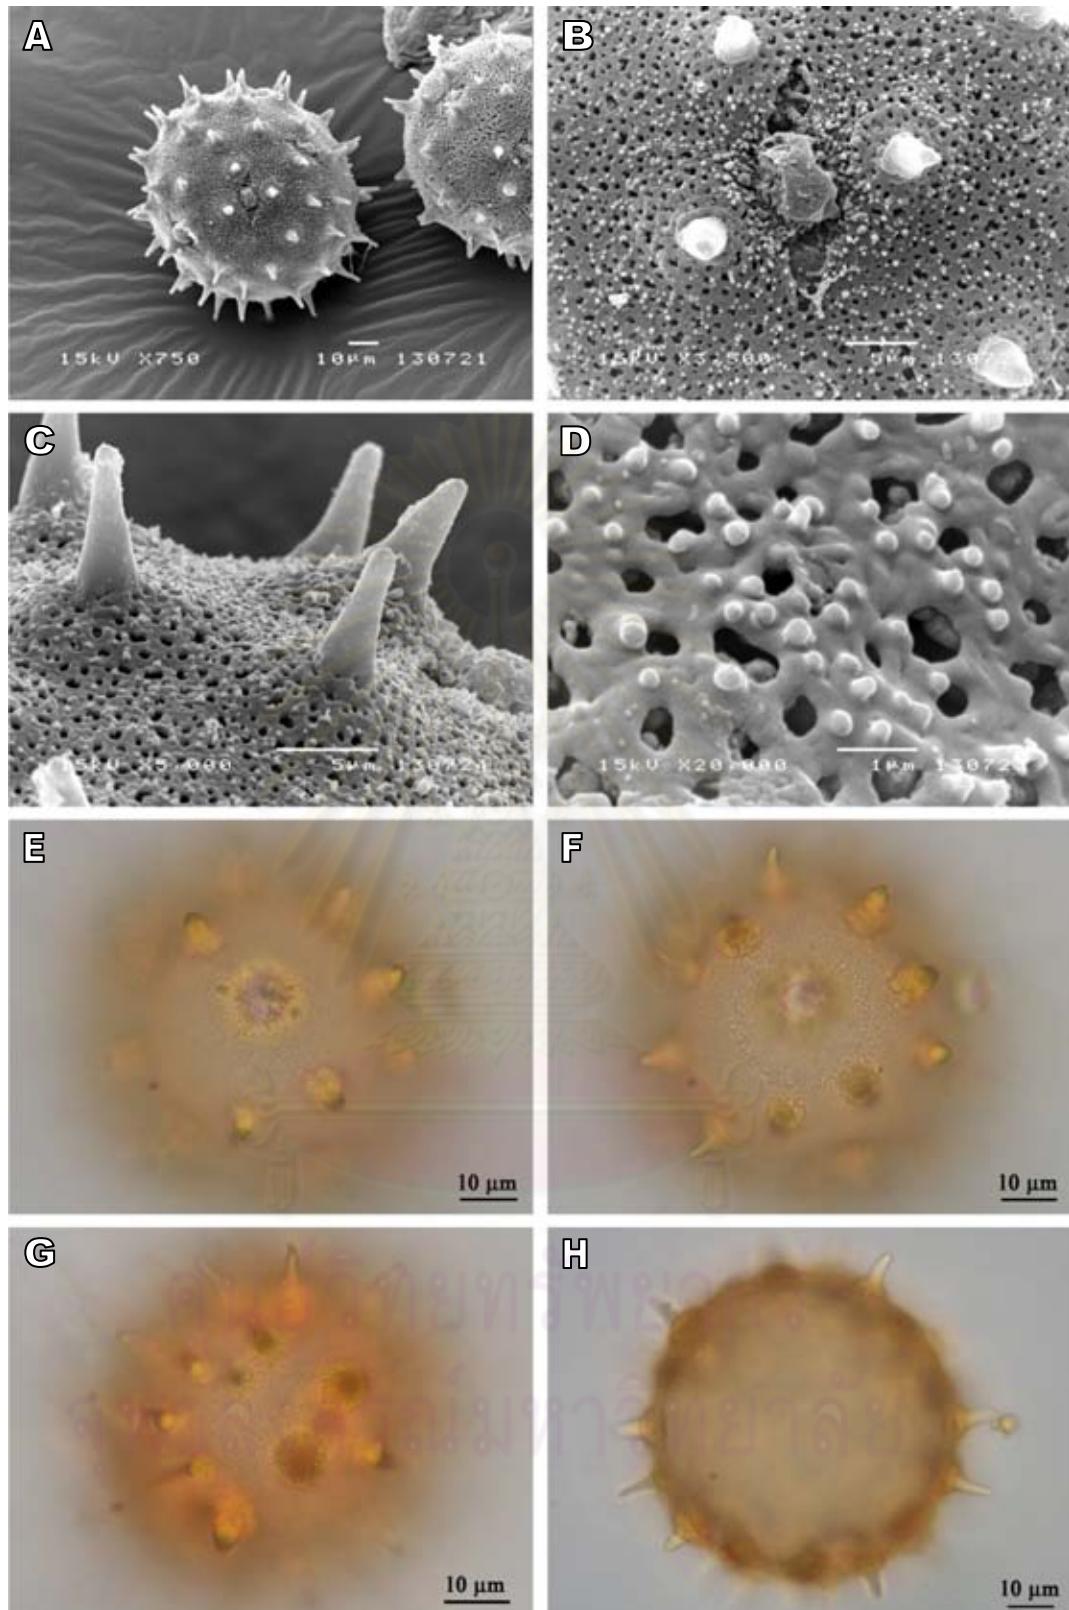

Plate 76 *Thespesia populnea* (L.) Sol. ex Corrêa: (A) Whole grain, (B) Colporus, (C) Ornamentation echinate, (D) Surface on interspinal area, (E) Ecotocolpus, (F) Endoporus, (G) columellae under tectum at interspinal area and cushion, (H) Optical section (A-D: SEM; E-H: LM).

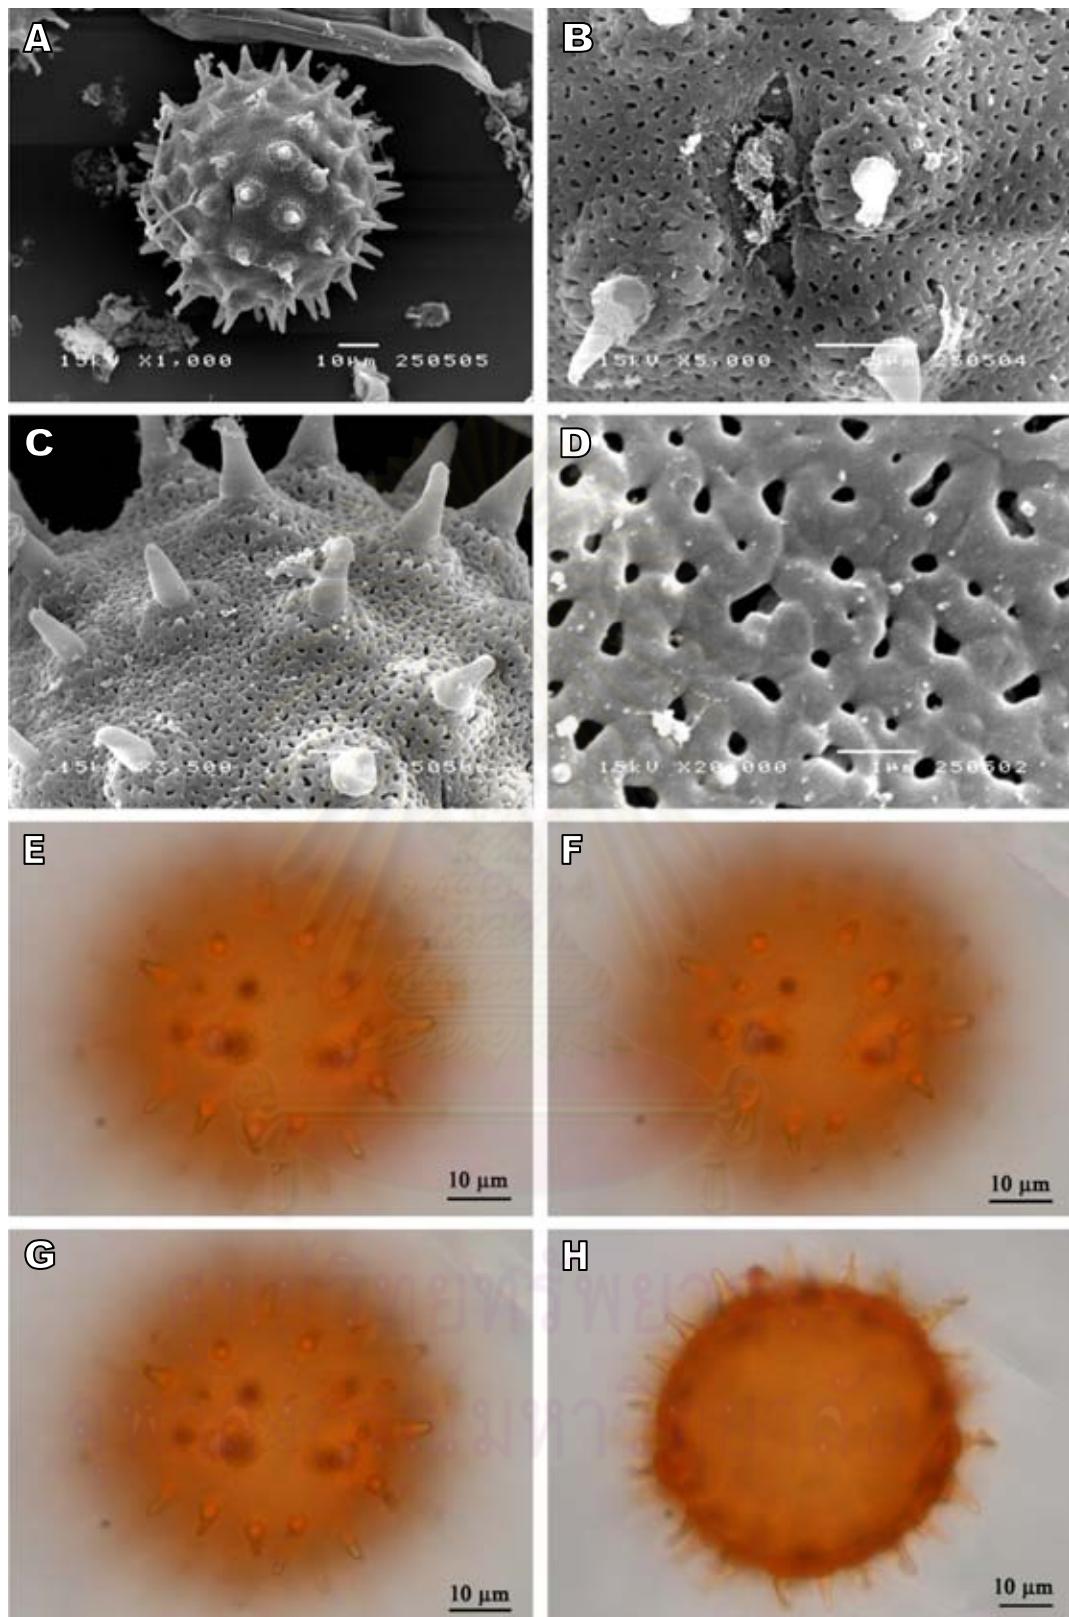

Plate 77 *Thespesia populneaoides* (Roxb.) Kostel.: (A) Whole grain, (B) Colporus, (C) Ornamentation echinate, (D) Surface on interspinal area, (E) Ecotocolpus, (F) Endoporus, (G) columellae under tectum at interspinal area and cushion, (H) Optical section (A-D: SEM; E-H: LM).

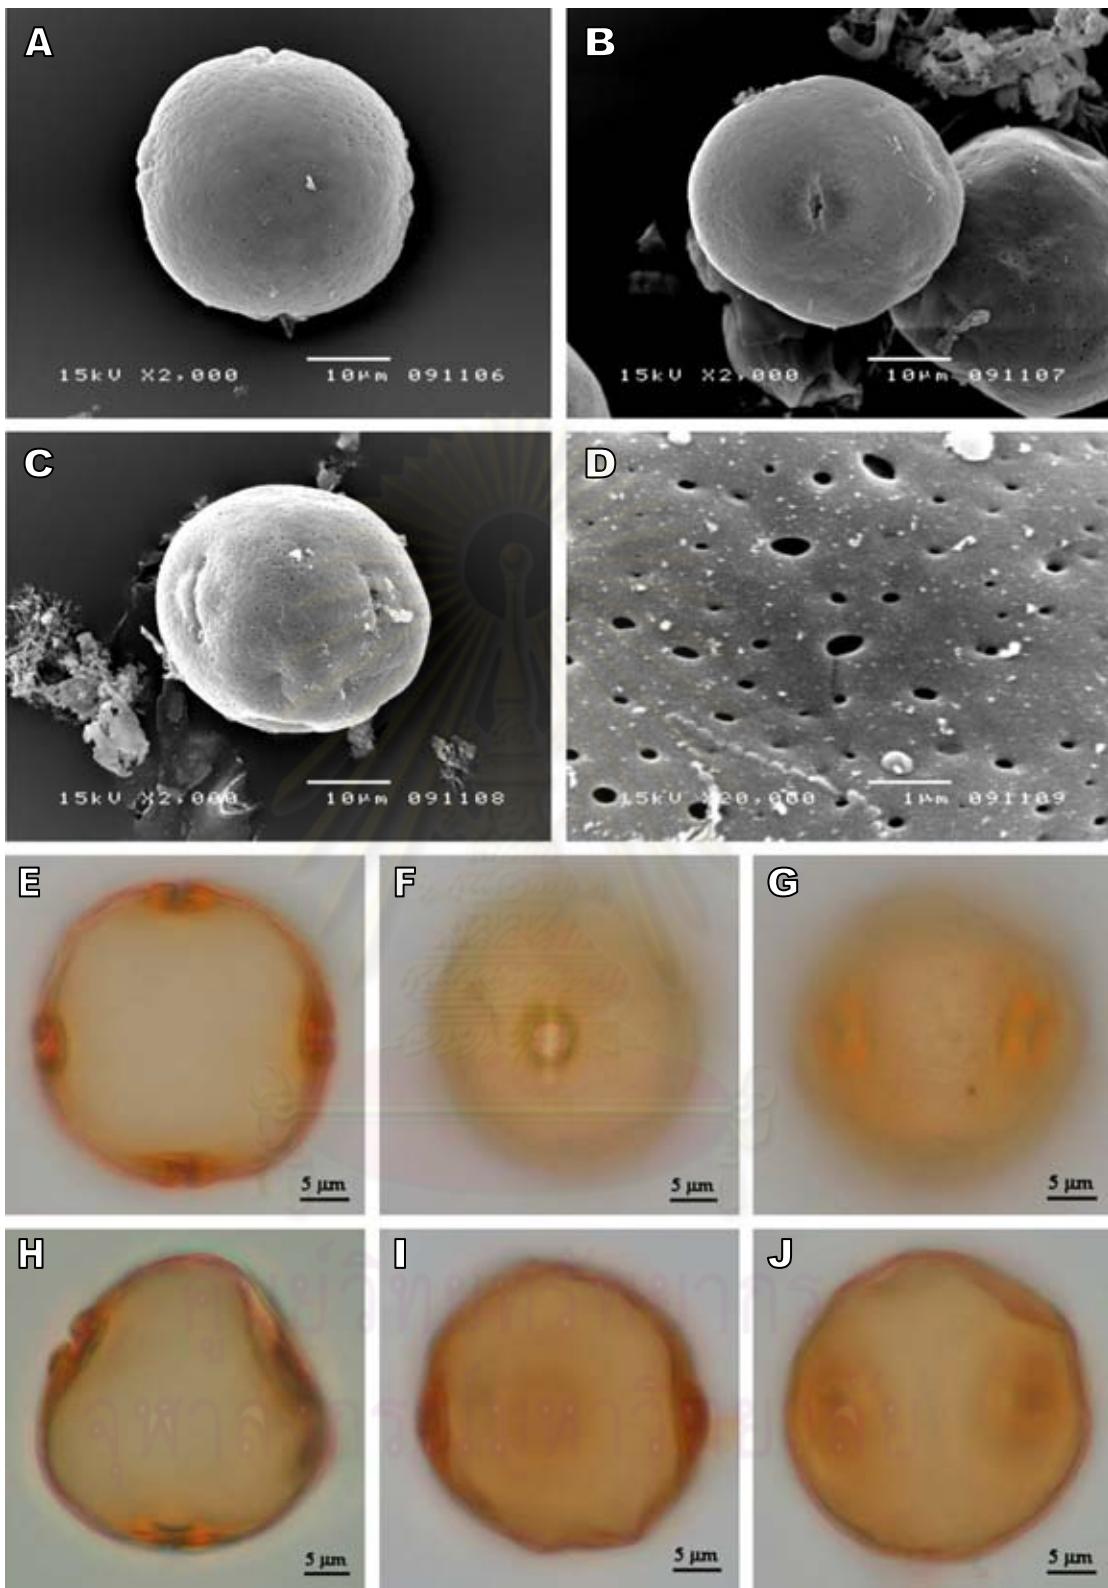

Plate 78 *Xylocarpus granatum* J. Koenig: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view of 4-aperturate grain, optical section, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view of 3-aperturate grain, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

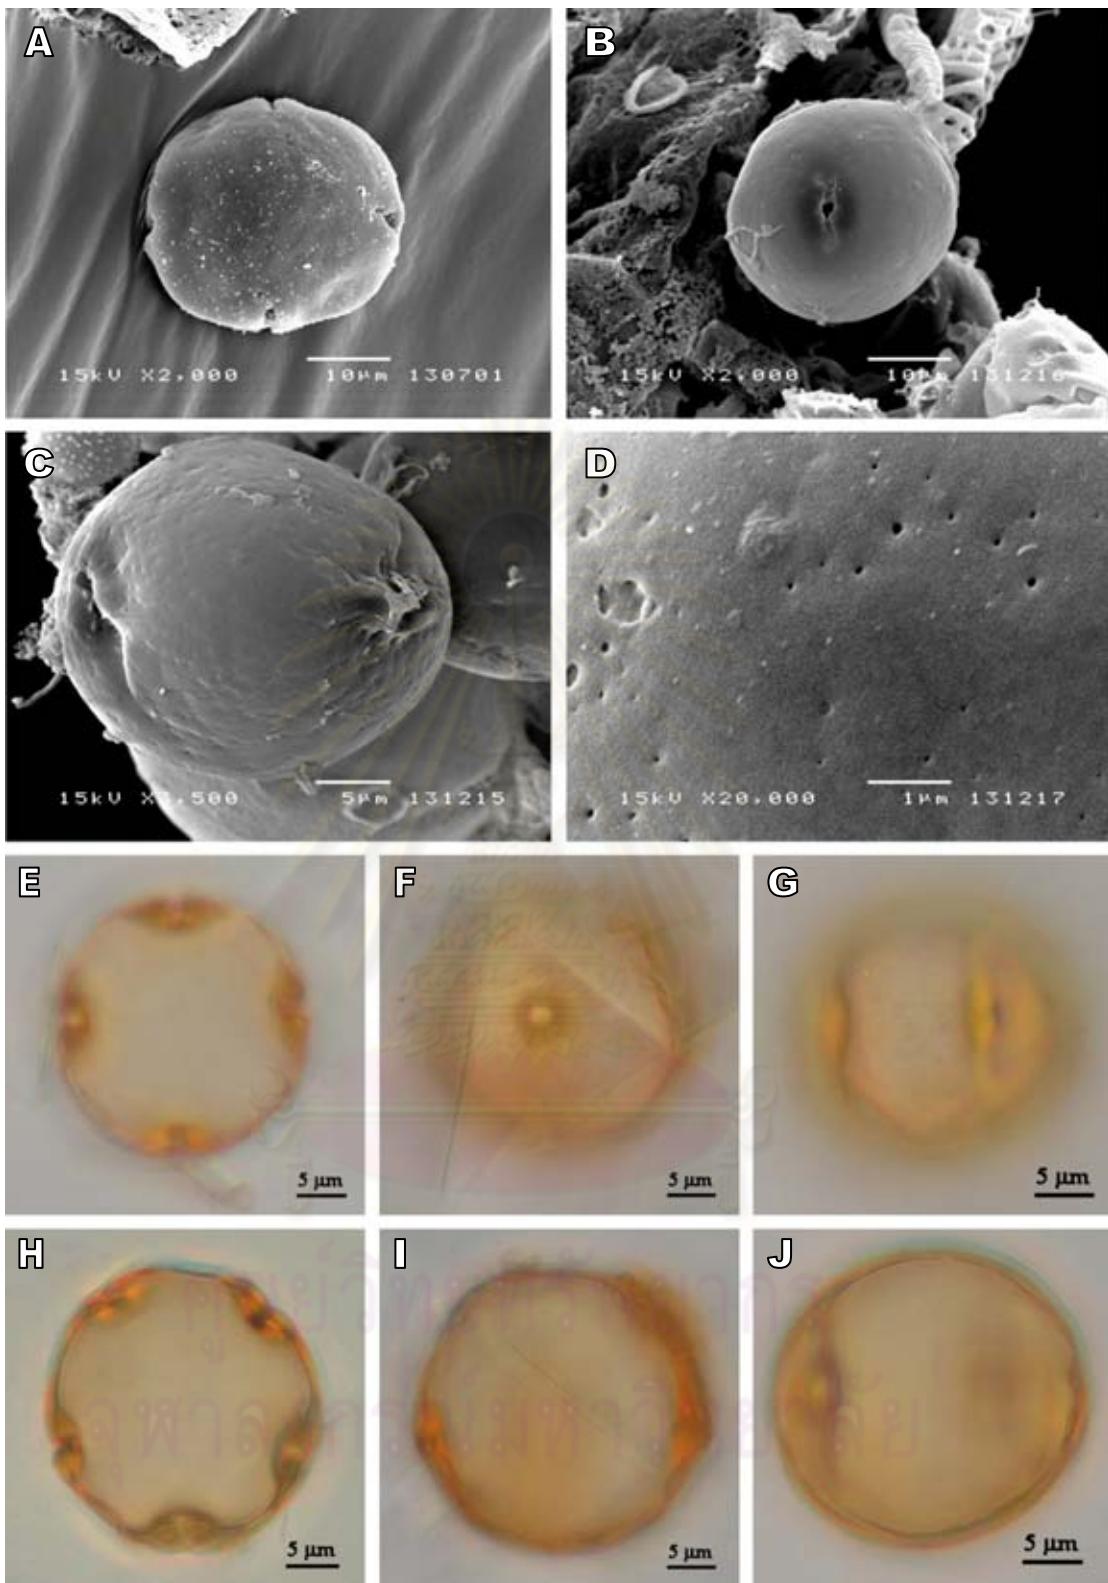

Plate 79 *Xylocarpus moluccensis* (Lam.) M. Roem.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view of 4-aperturate grain, optical section, (F) Equatorial view, endoaperture, (G) Equatorial view, mesocolpium surface, (H) Polar view of 5-aperturate grain, optical section, (I) Optical section under colporus, (J) Optical section under mesocolpium (A-D: SEM; E-J: LM).

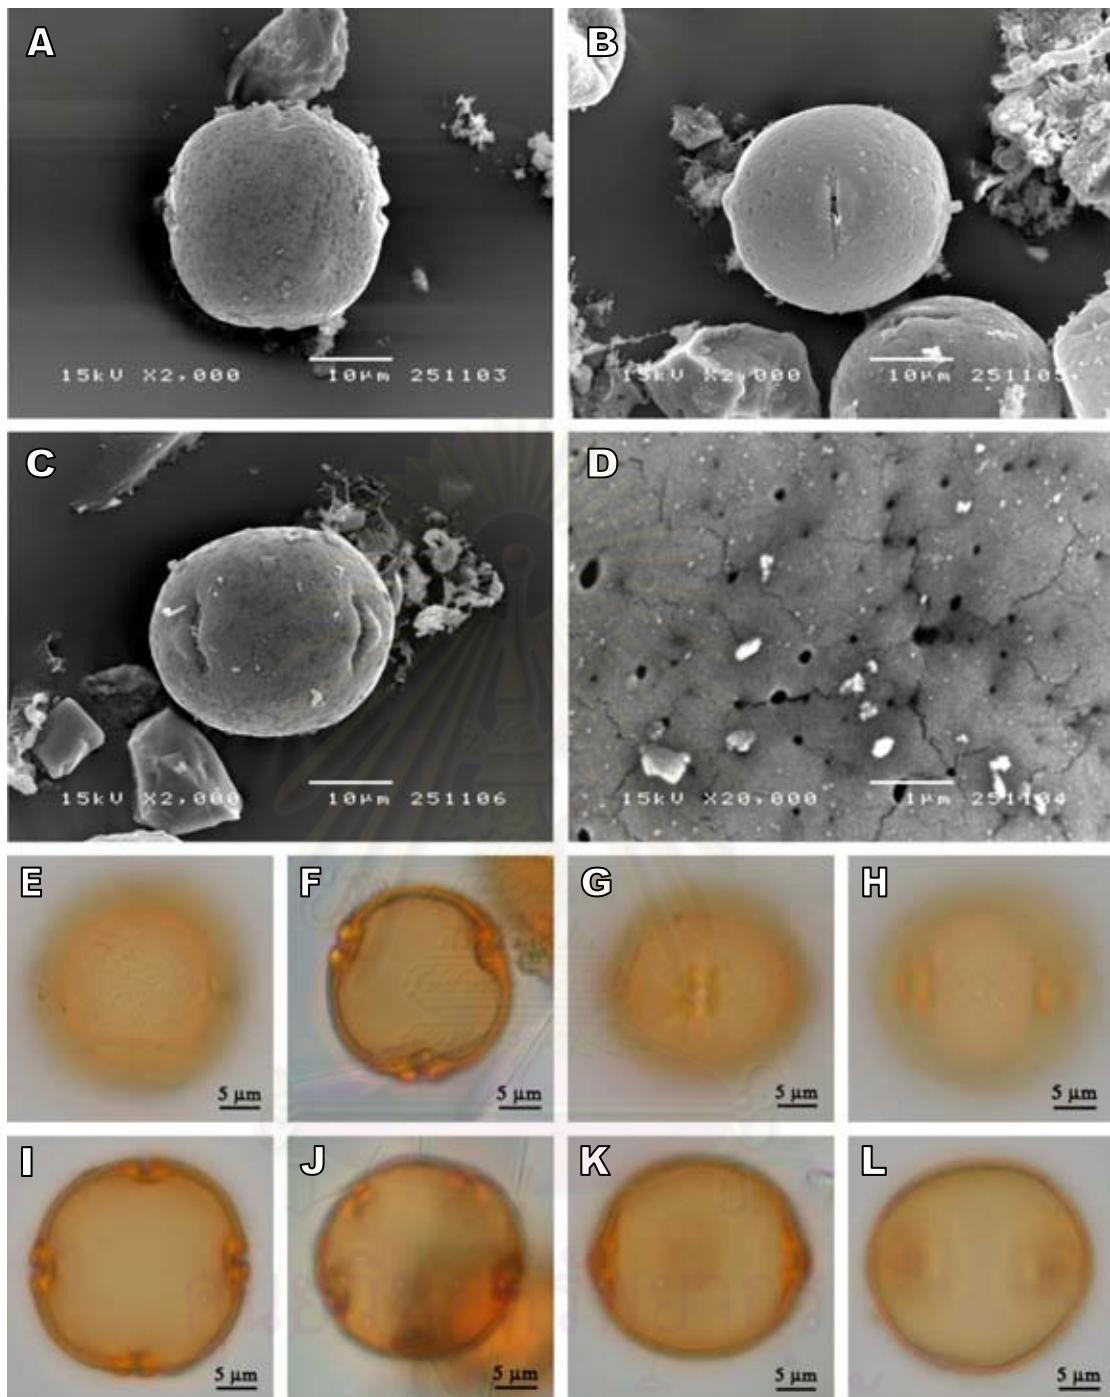

Plate 80 *Xylocarpus rumphii* (Kostel.) Mabb.: (A) Polar view, (B) Equatorial view, colporus, (C) Equatorial view, mesocolpium, (D) Equatorial view, surface, (E) Polar view of 4-aperturate grain, surface, (F) Polar view of 3-aperturate grain, optical section, (G) Equatorial view, endoaperture, (H) Equatorial view, mesocolpium surface, (I) Polar view of 4-aperturate grain, optical section, (J) Polar view of 5-aperturate grain, optical section, (K) Optical section under colporus, (L) Optical section under mesocolpium (A-D: SEM; E-L: LM).

CHAPTER V

DISCUSSION AND CONCLUSION

5.1 General pollen and spore morphology

There is a considerable variation in pollen and spore morphology of mangrove flora in Thailand. It can be divided into 53 pollen and spore types and 22 subtypes based, mainly, on characteristic of apertures, size, shapes and ornamentations etc.

5.1.1 Polarity

While all mangrove ferns have heteropolar spores, most flowering plants have isopolar pollen grains. Apolar pollen grains are found in the *Thespesia populnea* type which has polypantocolporate grains, and the *Suaeda maritima* type which has polypantoporate grains. Heteropolarity is found in monocolpate pollen grains of *Horsfieldia irya* type and *Phoenix paludosa* type, as well as monoporate pollen grains of *Flagellaria indica* type and *Pandanus odoratissimus* type. However, in *Atalantia monophylla* type, *Cynometra ramiflora* type, *Diospyros areolata* type, and *Heritiera littoralis* type, with generally isopolar and colporate grains, some grains of which have endoapertures that did not situate on equator but shift more or less toward poles. Thus, they are categorized in heteropolar pollen grains. Subisopolar pollen grains are found in *Ficus microcarpa* type. Pollen grains of *Acanthus volubilis* type and *Allophylus cobbe* type are generally isopolar but some grains are subisopolar.

5.1.2 Polar area index

The polar area index of pollen grains can vary from very small (0.14 as in *Melastoma saigonense* (Kuntze) Merr.) to large (0.76 as in *Aglaia cucullata* (Roxb.) Pellegr.). Besides, apocolpial field of *Barringtonia racemosa* type pollen grains are very small and are approximately 1 μm in diameter.

5.1.3 Shape and outline

Fern spores are generally in peroblate (as in *Stenochlaena palustris* (Burm. f.) Bedd.) to suboblate shape class (as in *Acrostichum aureum* L., *Acrostichum speciosum* Willd., *Lecanopteris sinuosa* (Wall. ex Hook.) Copel. , and *Pyrrosia adnascens* (Sw.) Ching). Shape of monolete spores is ellipsoidal or boat-shape while shape of trilete spores is tetrahedral to tetrahedral-globose.

For flowering plants, shape class is varying from peroblate (as in *Melaleuca cajuputi* Powell) to perprolate (as in *Acanthus ilicifolius* L.).

The polar outlines of pollen grains generally vary from triangular (to hexangular) with concave to convex sides to circular, or 6-lobate, or somewhat elliptic (as in *Ficus microcarpa* L. f.) to oblong-elliptic (as in *Horsfieldia irya* (Gaertn.) Warb.).

The equatorial outlines of pollen grains can vary from oblong-elliptic ($P>E$) to circular to elliptic ($P<E$). For monoporate pollen grains, there are two planes of equatorial axis length (longer and shorter equatorial axis). In *Horsfieldia irya* (Gaertn.) Warb., equatorial outline is triangular with flat-top on longer equatorial view, and slightly quadrangular on shorter equatorial view. In *Phoenix paludosa* Roxb., equatorial outline is circular-elliptic to elliptic on longer equatorial view, and circular-elliptic on shorter equatorial view.

5.1.4 Size

The range of size (average size of each species) of pollen grains and spores of mangrove plant species in Thailand is very wide. It is from very small (8.09 μm as in *Ficus microcarpa* L. f.) to very large (102.00 μm as in *Hibiscus tiliaceus* L.). Most pollen grains and spores are small to medium sized.

5.1.5 Aperture

For fern spore, laesurae are categorized into two laesura types, monolete (one laesura) and trilete (three laesurae or triradiate laesura).

For flowering plants, apertures are categorized into three main apertural types and their derivatives.

First, porate aperture type, aperture number of this aperture type is one (as in *Flagellaria indica* type and *Pandanus odoratissimus* type), two (as in *Ficus microcarpa* type), three (as in *Allophylus cobbe* type and *Sonneratia griffithii* type), and polyaperturate (as in *Suaeda maritima* type).

Second, colpate aperture type, aperture number of this type is one (as in *Horsfieldia irya* type, *Phoenix paludosa* type, or ring-like aperture in *Nypa fruticans* type), two (as in *Crinum asiaticum* type), and three (as in *Clerodendrum inerme* type, *Dolichandrone spathacea* type, and *Sesuvium portulacastrum* type).

Third, colporate aperture type, the majority of pollen grains are in this aperture type. Aperture number of this type is three to five or somewhat polyaperturate (as in *Thespesia populnea* type).

Fourth, heterocolpate aperture type, pollen grains comprise three colpori alternated with three colpi (as in *Calycopteris floribunda* type, *Lumnitzera littorea* type, *Melastoma saigonense* type, and *Terminalia catappa* type).

Last, 3-colpororate, pollen grains comprise ectoapertures, mesoapertures, and endoapertures (as in *Scyphiphora hydrophyllacea* type).

5.1.6 Exine or sclerine

For fern spores, perispore is easily detached from grains. Sometimes, spore have smooth surface instead of ornamented wall. The sclerine thickness is 0.8 μm (as in *Drynaria quercifolia* (L.) J. Sm. and *Lecanopteris sinuosa* (Wall. ex Hook.) Copel.) to 3.2 μm (as in *Pyrrosia piloselloides* (L.) M.G. Price).

For flowering plants, pollen grains are tectate imperforate, tectate perforate and semitectate. Under light microscopy, infratectal layer has columellae and clearly seen on both surface view and optical section. But in many species columellae seen to be indistinct, so scanning or transmission electron microscopy may help to ascertain the detail or exine stratification. The exine thickness is 0.6 μm (as in *Aegiceras corniculatum* (L.) Blanco, *Heritiera littoralis* Aiton (W. & A.) Clos, *Melaleuca cajuputi* Powell, and *Sesuvium portulacastrum* (L.) L.) to 10.4 μm (as in *Intsia bijuga* (Colebr.) Kuntze). The sexine is usually thicker than the nexine, somewhat the sexine is as thicker as or thinner

than nexine. In some case (as in *Sonneratia griffithii* type), exine at apocolpia is thicker than exine at other parts of grains.

5.1.7 Ornamentation

There are so many kinds of ornamentation of mangrove plant pollen grains and spores, but they can be grouped into three forms. The first one is the present of lumina or puncta on tectum. This form includes perforate, foveolate, microreticulate, reticulate, and fossulate pattern. The second form is various kinds of projections, i.e. echinate, microechinate, baculate, microbaculate, clavate, granulate, verrucate, gemmate, rugulate, microrugulate, striate, as well as the present of rodlets, globules and mass of particles on surface. The last form is no sculpturing which is called psilate. The combination of each pattern can occur in many cases, e.g., *Pluchea indica* type has echinate ornamentation, and has perforations present on area between echinae.

5.1.8 Comparing with the previous researches

This study found that pollen grains of *Cerbera manghas* L. and *Cerbera odollam* Gaertn. (Apocynaceae) have lolongate elliptic or subcircular endoapertures, But Sittha (2007) reported that pollen grains of these two species have lalongate elliptic to elliptic-circular endoapertures. Moreover, this study reported that the ornamentation on mesocolpia is different from other area, which was not reported in Sittha's study.

The pollen grains of *Glochidion littorale* Blume (Phyllantaceae) and *Melastoma saigonense* (Kuntze) Merr. (Melastomataceae) in this study are a little bit different from those in previous study (Chantaranothai, 1997; Kasetsinsombat, 1999) in size and shape.

For pollens of plants in Rhizophoraceae, there are some differences between this study and Boonsermsuk's study (1987). Boonsermsuk reported that pollen grians of *Bruguiera* spp. have perforate or rugulate-perforate ornamentation while pollen grains of those in this study have psilate ornamentation with very small round depressions. Besides, Boonsermsuk did not report the present of endocingula in pollen grains of *Bruguiera parviflora* (Roxb.) Wight & Arn. ex Griff., *Rhizophora apiculata* Blume, and *Rhizophora mucronata* Lam., which are found in this study.

5.2 Combination of pollens and spores in mangrove sediment

In mangrove sediment, many pollen and spore types can be found, such as *Acanthus volubilis* type, *Acrostichum speciosum* type, *Aegialitis rotundifolia* type, *Avicennia alba* type, *Ceriops decandra* type, *Excoecaria agallocha* type, *Lumnitzera littorea* type, *Nypa fruticans* type, *Phoenix paludosa* type, *Scyphiphora hydrophyllacea* type, *Sonneratia griffithii* type, and *Xylocarpus rumphii* type. The combination of these pollen and spore types can indicate that sediment is from mangrove habitat.

5.3 Ecological influence to tectum

Excluding fern spores of seven fern species, it is noticeable that pollen grains from 29 species of true mangrove species of flowering plants included in this study, there are pollen grains from 5 species are tectate imperforate, 13 species are tectate perforate with very small and minute puncta, and 11 species is semitectate which are microreticulate to reticulate with rather small size lumina.

Besides, these kinds of characters are also found in pollen grains of mangrove associates. There are only 6 (*Caesalpinia crista* L., *Dolichandrone spathacea* (L. f.) Seem., *Glochidion littorale* Blume, *Horsfieldia irya* (Gaertn.) Warb., *Intsia bijuga* (Colebr.) Kuntze, and *Peltophorum pterocarpum* (DC.) Backer ex K. Heyne) species of flowering plants of mangrove associates from 44 species of flowering plants of mangrove associates, which have pollen grains with widely opened microreticulate or reticulate ornamentation.

There are some researches reporting correlation between tectum and abiotic factors or environment. High temperature can affect wall architecture on microsporogenesis (Poroch and Jahn, 2001; Koti *et al.*, 2005). Hebda & Lott (1973, cited in Rowley, 1976: 43) reported that a variation of exine ornamentation related to environment. Higher temperature could cause the development of larger lumina relative to narrower muri (microreticulate) while lower ones cause smaller lumina relative to wider muri (foveolate). This effect is also similar to pollen grains of Eurasian species of the genus *Buxus* (Buxaceae). Pollen grains of this genus which have verrucate or pilate ornamentation as well as wide-mesh reticulate pattern are restricted to subtropics or

tropics with higher temperature while pollen grains which have finer reticulation are found in north or northwest regions with lower temperature (Brückner, 1993).

From the reports as mentioned above, they demonstrate that there is a correlation between temperature and tectal characteristic of pollen grains. However, the effect of climate condition to mangrove vegetation is not yet understood. Mangal occur in areas where the average annual temperature is at or above 18°C (Chapman, 1976; 1977, cited in Giesen *et al.*, 2006: 14). Many true mangrove species have morphological and physiological adaptation to inundation, high salinity and unstable soil, i.e., pneumatophores, salt glands, and stilt roots etc. (Hovenden and Allaway, 1994; Paliyavuth, Clough, and Patanaponpaiboon, 2004; Evans, Okawa, and Searcy, 2005).

There is no certain research reporting about the direct effect of salinity to tectal characteristic. However, Ambwani and Kumar (1993) found that plants in genus *Licuala* (Arecaceae) which distribute in saline water condition have pollen grains with coarser reticulate pattern than those in fresh water condition. Their result is not concordant with the result from this study.

5.4 Conclusion

Because of variation of taxa in different ranks included in this study, there is a considerable variation of pollen and spore morphology of mangrove flora in Thailand. It can be divided into 53 pollen and spore types and 22 subtypes based mainly on characteristic of apertures, size, shapes and ornamentations etc.

The correlation between tectal characteristic and abiotic factors in mangrove habitats is still obscure. But the result from this study suggests that pollen grains of mangrove species seem to have closed tectum.

This research is the first time to study mangrove pollen flora of Thailand. The result of this study gives rise to an idea about pollen and spore types of mangrove flora in Thailand. Moreover, the constructed key to pollen and spore types, the pollen and spore type descriptions, and permanent slides of pollen grains and spores can be used as a tool to identify mangrove plant species in Thailand to which unknown pollen grains and spores belong.

BIOGRAPHY

Mr. Noravit Chumchim was born on August 31st, 1985 in Phatthalung Province. He earned his Bachelor Degree of Science in Biology from the Department of Biology, Faculty of Science, Prince of Songkla University, Songkhla in 2008. Then, he continued his study in Master of Science in Botany from the Department of Botany, Faculty of Science, Chulalongkorn University from 2008-2010.
