Potentiometric titrations in which mixtures of two weak acids were titrated with a strong base, and in which multiple linear regression analysis was used to evaluate the equivalent volume of each single weak acid were discussed. The multiple linear equations derived were corrected by using thermodynamic dissociation constant (K_a°) instead of concentration dissociation constant (K_a). The accuracy and precision of the resulting values of equivalent volume depended on various parameters as followed: 1) Difference between pKa value (ΔpK_a), in which the accurate result could be obtained if ΔpK_a was between 0.93 and 5.02 as presented in this experiment. 2) Initial concentration ratios (X), should be in the range between 0.1 and 15 or in the acid mixtures which the slope of any point of titration curve was not more than 1.90. 3) Standard deviation of pH measurement and volume of base depended on the slope of the titration curve; therefore, the more value of slope of titration curve was, the more standard deviation obtained. 4) Titration data range, Method B was the most appropriate method for choosing titration data range since it was not include the deviation from Gran plots of each single acid. 5) Strictly controlled ionic strength of solution was necessary and important since it affected the liquid junction potential and caused deviation in activity coefficient, especially in the ionized acid mixtures which X=15, ionic strength changed from initial about 0.15 to 0.10 at the end of titration (50% change). 6) Experimental conditions must be carefully controlled ;e.g., temperature variation, prevention of solvation of carbon dioxide gas from atmosphere by passing nitrogen gas over the titration solution being titrated. In addition, the theoretically precisions of the equivalent volume of each single acid in weak acid mixtures were also studied by Pointwise method and found that the theoretical results corresponded very well with experimental results.

During the few years in laboratories of Pharmaceutical Chemistry Department, Chulalongkorn University, Thailand, this work has been performed to complete this dissertation. I am deeply indebted all people who have helped me along this work, in particular the following people:

Dr. Mitr Pathipvanich, my thesis advisor, for his helpful guidance, assistance, suggestions, and encouragement throughout my study.

Assistant Professor Dr. Usa Glagasigij, my thesis co-advisor, for her guidance, inspiration, encouragement and providing all facility throughout the course of study.

Associate Professor Pimpa Permpoon, Department of Mathematics, Faculty of Science, Chulalongkorn University, for her guidance, suggestions, thoughtful assistance during my investigation.

Associate Professor Suttatip Chantaraskul and all staff members of the Department of Pharmaceutical Chemistry, Faculty of Pharmaceutical Science, Chulalongkorn University for their kindness and helpful.

All members of the thesis committee for their helpful comments. Thanks are also due to Chulalongkorn University for granting partial financial support to fulfill this study.

Arunya Prachasitthisak and all my friends for their help, friendship, cheerfulness during my graduate study.

Finally, I would like to express my infinite gratitude to my mother for her love, understanding, encouragement and financial support to fulfill this study.

ml	Milliliter
meq	Milliequivalence
g	Gram
V	Volume of titrant (ml)
Ve	Volume of titrant at equivalent point (ml) (equivalent volume, ml)
Ve _A	The equivalent volume of weak acid A
Ve _B	The equivalent volume of weak acid B
Vo	Initial volume of weak acid solution (ml)
N	Normality of titrant
K _a	Dissociation constant of acid
K _a ^o	Thermodynamic dissociation constant of acid
K _w	Ionization constant of water
K _{aA}	Dissociation constant of acid A
K _{aB}	Dissociation constant of acid B
K _{aA} ^o	Thermodynamic dissociation constant of acid A
K _{aB} ^o	Thermodynamic dissociation constant of acid B
C _{HA}	Concentration of weak acid, HA
C _{OA}	Initial concentration of weak acid, A
C _{OB}	Initial concentration of weak acid, B
[a]	Concentration of substance a (Molar concentration of a)
{a}	Activity of substance a
C _i	Concentration of ion i
Z _i	Charge of ion i

γ_{\pm}	The activity coefficient
$\epsilon_{\text{H}_2\text{O}}$	The static dielectric constant of water
δ^+, δ^-	The contributions of the cation and anion, respectively
σ_x , S.D.	Standard error, standard deviation of variable x
σ^2_x	Variance of variable x
%C.V.	Coefficient variation
r_x	True residual of X = observed value of x - true value of x
f	Titration parameter = V_N/V_0C_0
x	Concentration ratio = $C_{0B}/C_{0A} = V_{eB}/V_{eA}$
r	Dilution parameter = C_{0A}/N
Gran plots	Modified gran plots of titration data prior to equivalent point which accounted for autoprotolysis of water, also called G plot.
