## **APPENDICES**

## APPENDIX A

### Physicochemical properties of drugs and substances

#### 1. Diltiazem hydrochloride (Mazzo, Obetz and Shuster, 1994)

##### **1.1 Chemical name**

(2S-cis)-3-(acetoxy-5-[2-(dimethylamino)ethyl]-2,3-dihydro-2-(4-methoxy-phenyl)-1,5-benzothiazepin-4(5H)-one-monohydrochloride

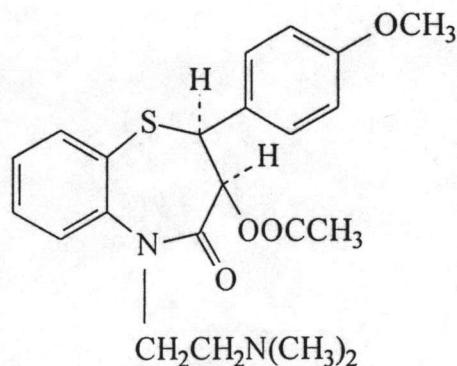

##### **1.2 Molecular formula**

##### **1.3 Molecular weight**

450.98 g/mole

##### **1.4 Chemical structure**

##### **1.5 Appearance**

Diltiazem hydrochloride is a white to off-white crystalline powder. It is odorless and has a bitter taste.

##### **1.6 Solubility**

Diltiazem hydrochloride is freely soluble in water, methanol, chloroform, formic acid; sparingly soluble in dehydrated alcohol; practically insoluble in benzene; and insoluble in ether.

### ***1.7 Melting point***

Diltiazem hydrochloride melts at about 210°C (207.5–212°C) with decomposition at higher temperature.

### ***1.8 Dissociation constant***

The pKa of diltiazem is 7.7 (Illum, Bundgaard and Davis, 1983).

### ***1.9 Partition coefficient***

Diltiazem is reported to have a partition coefficient of 597 between octanol and aqueous buffer pH 7.4 (Rabiskova, Polasek and Valaskova, 1997). Illum et al. (1983) reported that the log P of diltiazem was 2.70.

### ***1.10 Crystal properties and conformation***

Diltiazem hydrochloride exists as a crystalline powder. It has been crystallized as fine needle from ethanol-isopropanol. No polymorphs of diltiazem hydrochloride have been reported to date.

### ***1.11 Stability***

In the solid state, diltiazem is reported to be highly stable. In aqueous buffer solutions (pH 1-7), diltiazem undergoes hydrolysis to desacetyl diltiazem. Diltiazem is most stable at pH 5. The decomposition follows pseudo-first order kinetics. UV radiation causes more degradation.

### ***1.12 Parenteral dosage form***

Diltiazem hydrochloride is available as a 5 mg/ml solution (Hoechst Marion Roussel). It is administered intravenously by direct injection over two minutes. Following dilution in 100 to 500 ml of a compatible intravenous solution, the drug also may be given by continuous infusion for up to 24 hours (Trissel, 1994).

## **2. Theophylline (Cohen, 1975)**

### ***2.1 Chemical name***

1,3-Dimethylxanthine

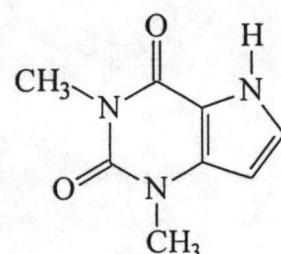

### ***2.2 Molecular formula***

C<sub>7</sub>H<sub>8</sub>N<sub>4</sub>O

### ***2.3 Molecular weight***

180.17 g/mole

### ***2.4 Chemical structure***

### ***2.5 Appearance***

Theophylline is a white crystalline powder, odorless with a bitter taste.

### ***2.6 Solubility***

The reported solubility of theophylline is 8.3 mg/ml in water; 12.5 mg/ml in ethanol; 11.6 mg/ml in chloroform; and sparingly soluble in ether.

### ***2.7 Melting point***

The original synthetic literature reported melting point of 264°C for theophylline subsequently the melting range has been reported to be between 271°C and 274°C.

### ***2.8 Dissociation constant***

Theophylline is a weakly acidic compound with the proton on the nitrogen in position 7 being dissociable. The pKa in aqueous of theophylline

determined both potentiometrically and spectrophotometrically is 8.6. Theophylline is also very weakly basic and pK<sub>b</sub>'s of 13.5 and 11.5 have been reported in the literature from aqueous potentiometric measurements.

### *2.9 Partition coefficient*

Theophylline is reported to have a partition coefficient of  $0.755 \pm 0.01$  between octanol and phosphate buffer pH 7.4 (Cotgreave and Caldwell, 1983).

### *2.10 Stability*

Theophylline solutions are generally quite stable over the entire pH range. Strongly alkaline solutions ( $\text{pH} > 12$ ) show decomposition and apparent ring opening after several weeks. Solutions of theophylline have been shown to be susceptible to oxidation at position 8 forming 1,3-dimethyluric acid in the presence of methylene blue which acts as a photosensitizing dye.

### *2.11 Parenteral dosage form*

Theophylline is available as 0.4 – 4 mg/ml solution (Abbott, Baxter, McGaw). It may be administered by continuous or intermittent intravenous infusion. (Trissel, 1994)

## **3. Piroxicam (Lund, 1994; Mihalic' et al., 1986)**

### *3.1 Chemical name*

4-Hydroxy-2-methyl-N-(2-pyridyl)-2H-1,2-benzothiazine-3-carboxamide-1,1-dioxide

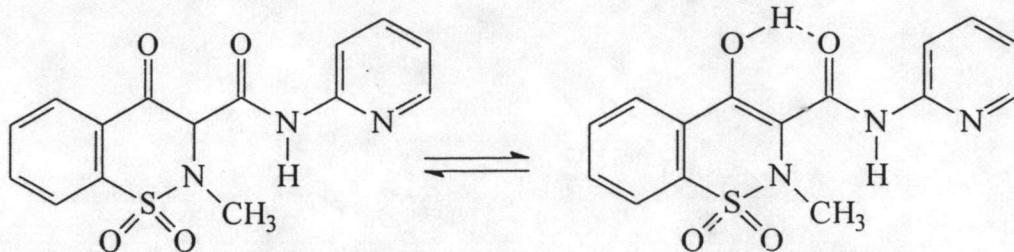

### *3.2 Molecular formula*

$\text{C}_{15}\text{H}_{13}\text{N}_3\text{O}_4\text{S}$

### *3.3 Molecular weight*

331.36 g/mole

### 3.4 Chemical structure

### 3.5 Appearance

Piroxicam is an off-white to light tan or light yellow, odourless powder. It forms a monohydrate that is yellow. It is reported to have a bitter taste.

### 3.6 Solubility

Piroxicam is not soluble in water and cyclohexane; sparingly soluble in di-isopropyl ether and in toluene; only slightly more soluble in lower aliphatic alcohols :methanol, ethanol, and isopropanol; soluble in some polar organic solvents such as dimethylformamide (1g/10ml), dimethylsulphoxide (1g/10ml), chloroform (1g/20ml), and somewhat less soluble in dioxane (1g/40ml), acetone (1g/50ml), and ethyl acetate (1g/80ml).

### 3.7 Melting point

Piroxicam melts in the range 198°C to 200°C.

### 3.8 Dissociation constant

A saturated solution of piroxicam in dioxan:water (2:1) has a pKa of 6.3 (enolic hydroxyl group at C-4) (Lombardino, Wiseman and Chiaini, 1973; Lund, 1994; Mihalic' et al., 1986). Some literature reported a pKa of 5.3 for piroxicam (Herzfeldt and Kümmel, 1983).

### 3.9 Partition coefficient

Piroxicam is reported to have a partition coefficient of 1.8 between octanol and aqueous buffer pH 7.4.

### ***3.10 Crystal properties and conformation***

It is reported that piroxicam can exist in two interconvertible crystal polymorphic forms. When allowed to crystallize from an ethanolic solution by fast cooling, piroxicam precipitates as needle form (melts in the range 196°C to 198°C), while by slow cooling from the same solution precipitates in cubic form (melts in range 199°C - 201°C). The two forms can be differentiated by infrared absorption and by X-ray diffraction techniques.

The piroxicam molecule is not far from being planar (~bc plane). The thiazine ring exhibits a half-chair conformation. An amide group is involved in an intramolecular hydrogen bond with the hydroxy group. It also forms an intermolecular hydrogen bond with the oxygen atom bonded with the sulfur atom, connecting piroxicam molecules in an infinite chain along b axis. The molecular packing is also influenced by van der Waals interaction.

Piroxicam monohydrate, unlike the piroxicam structure, exists in a zwitterionic form, the enolic hydrogen having been transferred to the pyridine nitrogen. Two intramolecular hydrogen bonds are formed by an internal rotation of the neutral structure (between enolate oxygen and hydrogen on amide nitrogen, and between carbonyl oxygen and the hydrogen on pyridine nitrogen). The side chain and the atoms in the thiazine ring are planar.

Some study reported the piroxicam exists in four polymorphic forms and at least one pseudopolymorphic modification (Vrečer, Srčic and Šmid-Korbar, 1991).

### ***3.11 Stability***

In solid state, piroxicam is stable at 20°C and at 40°C for two years when protected from light.

In aqueous solution, a stability of piroxicam is a function of pH. Piroxicam changes into a yellow in acidic medium. At very low pH protonation of

the pyridine nitrogen can occur. At increasing pH, the enol hydroxy starts to deprotonate and the whole equilibrium shifts rightwards (see in the chemical structure). This change is related to a tautomeric equilibrium rather than to chemical decomposition as a consequence of a possible hydrolysis reaction (Fini and Rabasco, 1992).

### **3.12 Parenteral dosage form**

Piroxicam is available as 20 mg/ml solution (Abbott, Baxter, McGaw). It may be administered by intramuscular injection (Lund, 1994).

## **4. Ibuprofen (Lund, 1994)**

### **4.1 Chemical name**

2-(4-Isobutylphenyl)-propionic acid  
 $\alpha$ -methyl-4-(2-methylpropyl)-benzene-acetic acid

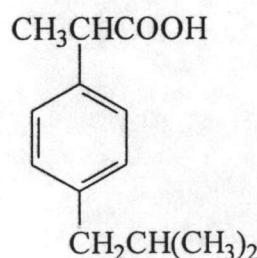

### **4.2 Molecular formula**

C<sub>13</sub>H<sub>18</sub>O<sub>2</sub>

### **4.3 Molecular weight**

206.3 g/mole

### **4.4 Chemical structure**

### **4.5 Appearance**

Ibuprofen exists as a white crystalline powder or colourless crystals.

#### **4.6 Solubility**

Ibuprofen is practically insoluble in water; soluble 1:1.5 in ethanol, 1:2 in ether, 1:1 in chloroform, and 1:1.5 in acetone; soluble in most organic solvents; soluble in aqueous solutions of alkali hydroxides and carbonates; freely soluble in dichloromethane.

#### **4.7 Melting point**

Ibuprofen melts in the range 75°C to 78°C.

#### **4.8 Dissociation constant**

The pKa of ibuprofen is 5.3 (Herzfeldt and Kümmel, 1983; Lund, 1994). Some literature reported a pKa of 4.4 and 5.2 for ibuprofen (Greenfield et al., 1986).

#### **4.9 Partition coefficient**

Ibuprofen is reported to have a log of partition coefficient (log P) of 4.50 between octanol and aqueous buffer pH 7.4 for undissociated form. Fini, Laus, et al., (1986) reported the solubility of ibuprofen in aqueous buffer pH2 and in octanol as a function of temperature. The result is as following:  $3.4 \times 10^{-5}$  M and 0.059M in 5°C ( $\log P = 3.24$ );  $4.3 \times 10^{-5}$  M and 0.091M in 25°C ( $\log P = 3.33$ );  $5.21 \times 10^{-5}$  M and 0.122M in 37°C ( $\log P = 3.37$ ), respectively.

#### **4.10 Crystal properties and conformation**

Ibuprofen has a chiral centre and exist in two enantiomeric forms. After administration of the racemic mixture, the pharmacologically inactive *R*-(*-*)-enantiomer is converted to the active *S*-(+)-enantiomer.

#### **4.11 Stability**

In the absence of oxygen, ibuprofen is stable, even at high temperature (105°C to 110°C), for at least four days.

## 5. Triglyceride (Weiner, 1993)

### 5.1 Chemical name

- Trimyristin: Tri-butadecanoic-glyceride  
 Tripalmitin: Tri-hexadecanoic-glyceride  
 Tristearin: Tri-octadecanoic-glyceride

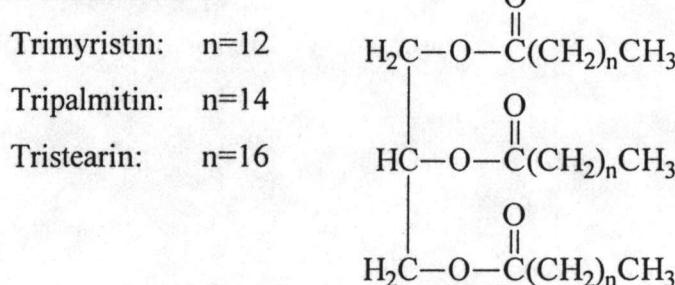

### 5.2 Molecular formula

- Trimyristin: C<sub>45</sub>H<sub>86</sub>O<sub>6</sub>  
 Tripalmitin: C<sub>51</sub>H<sub>98</sub>O<sub>6</sub>  
 Tristearin: C<sub>57</sub>H<sub>110</sub>O<sub>6</sub>

### 5.3 Molecular weight

- Trimyristin: 723.18 g/mole  
 Tripalmitin: 807.35 g/mole  
 Tristearin: 891.51 g/mole

### 5.4 Chemical structure

### 5.5 Appearance

Trimyristin and tristearin are hard, yellowish white powders, while tripalmitin is a hard and faintly yellow-white pellet. They have slight odor and taste suggesting tallow.

### 5.6 Solubility

Trimyristin, tripalmitin, and tristearin are insoluble in water.

### **5.7 Melting point**

Trimyristin: 56-57°C

Tripalmitin: 58-64°C

Tristearin: 58-63°C

### **5.8 Purity**

Trimyristin: ≥97% trimyristin assay by gas chromatography

Tripalmitin: ~95% tripalmitin assay by gas chromatography

~55% tripalmitin assay by thin layer chromatography

Tristearin: ~65% tristearin mixed with 30% tripalmitin assay by  
gas chromatography

## **6. Stearic acid (Wade and Weller, 1994)**

### **6.1 Chemical name**

Octadecanoic acid

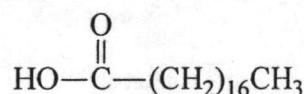

### **6.2 Molecular formula**

C<sub>18</sub>H<sub>36</sub>O<sub>2</sub>

### **6.3 Molecular weight**

284.47 g/mole

### **6.4 Chemical structure**

### **6.5 Appearance**

Stearic acid is a hard, white or faintly yellow colored, somewhat glossy, crystalline solid or a white, or yellowish white, powder. It has a slight odor and taste suggesting tallow.

### ***6.6 Solubility***

Stearic acid is freely soluble in benzene, carbon tetrachloride, chloroform and ether; soluble in ethanol, hexane and propylene glycol; practically insoluble in water.

### ***6.7 Melting point***

Stearic acid melts at the temperature higher than 54°C.

### ***6.8 Purity***

The BP1993 and the USPNF 23 describe stearic acid as a mixture of stearic acid and palmitic acid. The content of stearic acid is not less than 40.0% and the sum of the two acids is not less than 90.0%.

### ***6.9 Safety***

Stearic acid is widely used in oral and topical pharmaceutical formulations; it is also used in cosmetics and food products. Stearic acid is generally regarded as a nontoxic and nonirritant material. However, consumption of excessive amounts may be harmful.

LD<sub>50</sub> (mouse, IV): 23 mg/kg

LD<sub>50</sub> (rabbit, skin): >5 g/kg

LD<sub>50</sub> (rat, IV): 21.5 mg/kg

## **7. Soybean oil (Wade and Weller, 1994)**

### ***7.1 Chemical name***

Soybean oil

### ***7.2 Appearance***

Soybean oil is a pale yellow colored, odorless or almost odorless liquid, with a bland taste.

### **7.3 Solubility**

Soybean oil is practically insoluble in ethanol (95%) and water; miscible with carbon disulfide, chloroform, ether and petroleum spirit (boiling range 40-60°C).

### **7.4 Typical properties**

Autoignition temperature	: 445°C
Flash point	: 282°C
Freezing point	: -10 to -16°C
Density	: 0.916-0.922 g/cm <sup>3</sup> at 25°C

### **7.5 Purity**

A typical analysis of refined soybean oil indicates the composition of the acids, present as glycerides, to be: linoleic acid 50-57%; linolenic acid 5-10%; oleic acid 17-26%; palmitin acid 9-13%; and stearic acid 3-6%. Other acids are present in trace quantities.

### **7.6 Safety**

Soybean oil is widely used intramuscularly as a drug vehicle, or as a component of emulsions used in parenteral nutrition regimens; it is also consumed as an edible oil. Generally, soybean oil is regarded as an essentially nontoxic and nonirritant material. However, serious adverse reactions to soybean oil emulsions administered parenterally have been reported. These conclude cases of hypersensitivity, CNS reactions and fat embolism.

LD<sub>50</sub> (mouse, IV): 22.1 g/kg

LD<sub>50</sub> (rat, IV): 16.5 g/kg

## 8. Egg lecithin (Wade and Weller, 1994)

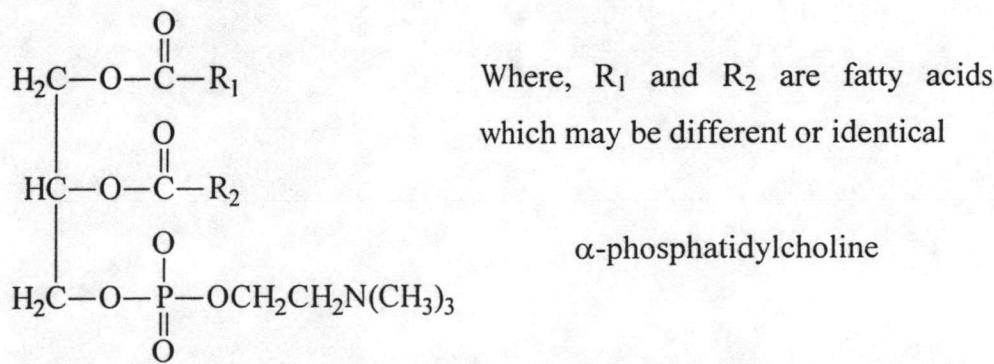

### 8.1 Chemical name

The chemical nomenclature and CAS registry numbering of lecithin is complex. The commercially available lecithin, used in cosmetics, pharmaceuticals and food products, although a complex mixture of phospholipids and other materials, may be referred to in some literature sources as 1,2-diacyl-*sn*-glycero-3-phosphocholine (trivial chemical name, phosphatidylcholine). This material is the principal constituent of egg lecithin and has the same CAS registry number.

### 8.2 Empirical formula

The USPNF 23 describes lecithin as a complex mixture of acetone-insoluble phosphatides, which consist chiefly of phosphatidylcholine, phosphatidylethanolamine, phosphatidylserine and phosphatidylinositol, combined with various amounts of other substances such as triglycerides, fatty acids and carbohydrates as separated from a crude vegetable oil source.

### 8.3 Chemical structure

The structure above shows phosphatidylcholine, the principal component of egg lecithin, in its  $\alpha$ -form. In the  $\beta$ -form the phosphorus containing group and the R<sub>2</sub> group exchange positions.

#### **8.4 Appearance**

Lecithins vary greatly in their physical form, from viscous semiliquids to powders, depending upon the free fatty acid content. They may also vary in color from brown to light yellow, depending upon whether they are bleached or unbleached.

#### **8.5 Solubility**

Lecithins are soluble in aliphatic and aromatic hydrocarbons, halogenated hydrocarbons, mineral oil and fatty acids. They are practically insoluble in cold vegetable and animal oils, polar solvents and water. When mixed with water, however, lecithins hydrate to form emulsions.

#### **8.6 Safety**

Lecithin is a component of cell membranes and is therefore consumed as a normal part of the diet. Although excessive consumption may be harmful, oral doses of up to 80 g daily have been used therapeutically in the treatment of tardive dyskinesia. When used in topical formulations lecithin is generally regarded as a nonirritant and nonsensitizing material. It has been accepted as a additive in parenteral medicines.

### **9. Poloxamer407 (Wade and Weller, 1994)**

#### **9.1 Chemical name**

$\alpha$ -Hydro- $\omega$ -hydroxypoly-(oxyethylene)-poly-(oxypropylene)-poly-(oxyethylene) block copolymer.

#### **9.2 Molecular weight**

9840-14600 g/mole

#### **9.3 Chemical structure**

Which  $a$  in the general formula given above averages 101 and  $b$  averages 56.

#### ***9.4 Appearance***

Poloxamer407 generally occur as a white-colored, waxy, free flowing prilled granules or as cast solids. It is practically odorless and tasteless.

#### ***9.5 Solubility***

Poloxamer407 is freely soluble in water, ethanol, and isopropyl alcohol.

#### ***9.6 Melting point***

The melting point of poloxamer407 is about 56°C.

#### ***9.7 Safety***

Poloxamer407 is used in variety of oral, parenteral and topical pharmaceutical formulations and is generally regarded as nontoxic and nonirritant material. Poloxamer407 is not metabolized in the body.

### **10. Tween80 (Wade and Weller, 1994)**

#### ***10.1 Chemical name***

Polyoxyethylene 20 sorbitan monooleate

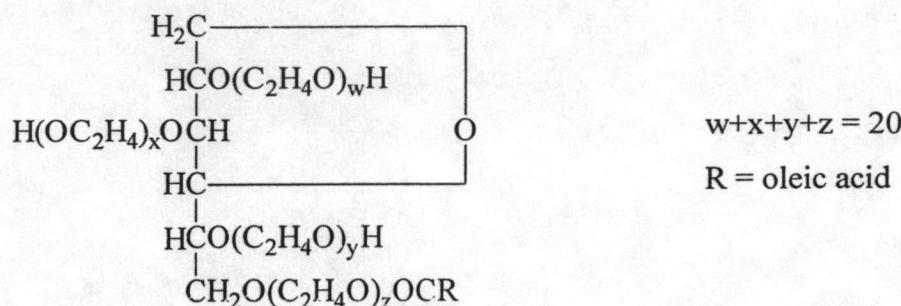

#### ***10.2 Molecular formula***

C<sub>64</sub>H<sub>124</sub>O<sub>26</sub>

#### ***10.3 Molecular weight***

1310 g/mole

#### **10.4 Chemical structure**

#### **10.5 Appearance**

Tween80 is a clear yellowish or brownish-yellow oily liquid with a faint characteristic odor, somewhat bitter taste. It has a HLB value of 15.0.

#### **10.6 Solubility**

Tween80 is miscible with water, alcohol, dehydrate alcohol, ethyl acetate, and methyl alcohol; practically insoluble in liquid paraffin and fixed oils.

#### **10.7 Safety**

Tween80 is widely used in cosmetics, food products and oral, parenteral and topical pharmaceutical formulations and is generally regarded as nontoxic and nonirritant material. The WHO has set an estimated acceptable daily intake for tween80, calculated as total polysorbate esters, at up to 25 mg/kg.

## APPENDIX B

### Calibration Curve

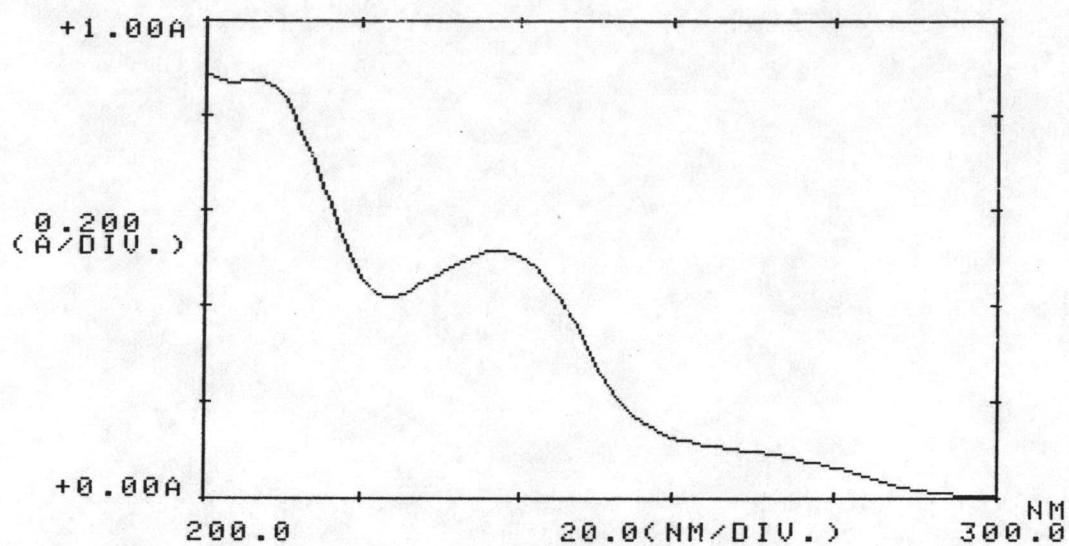

#### B1. The UV-visible spectrophotometric method

The UV-visible spectrophotometric method was used to determine the quantity of diltiazem hydrochloride, theophylline and piroxicam. The drug concentrations in water and 0.9% sodium chloride solution were determined from a beers law plot of standard that were linear from 2-16 µg/ml for diltiazem hydrochloride and theophylline, and 2-20 µg/ml for piroxicam. The wavelength used to analyze diltiazem hydrochloride, theophylline, and piroxicam in this study were 237, 272, and 360 nm, respectively, which were the  $\lambda_{\max}$  of drug absorbances in both two mediums. These spectra in water were shown in Figures b1-b3. And their spectra in 0.9% sodium chloride solution were the similar to these.

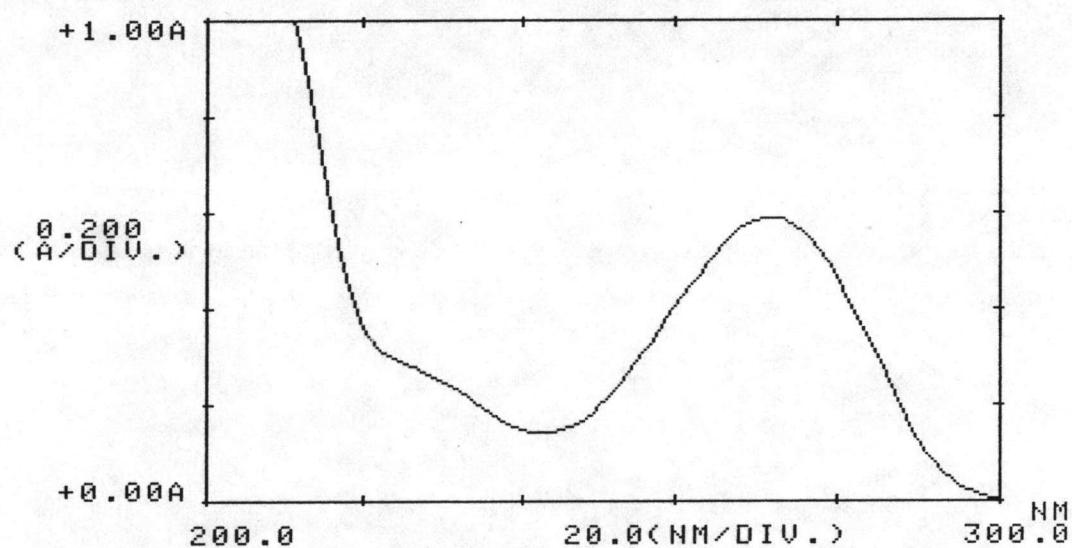

The data of relationship between concentration and absorbance of diltiazem hydrochloride in water and 0.9% sodium chloride solution at 237 nm are presented in Tables b1-b2, and the calibration curves of diltiazem hydrochloride in these mediums are illustrated in Figures b4-b5, respectively.

The data of relationship between concentration and absorbance of theophylline in water and 0.9% sodium chloride solution at 272 nm are presented in Tables b3-b4, and the calibration curves of theophylline in these mediums are illustrated in Figures b6-b7, respectively.

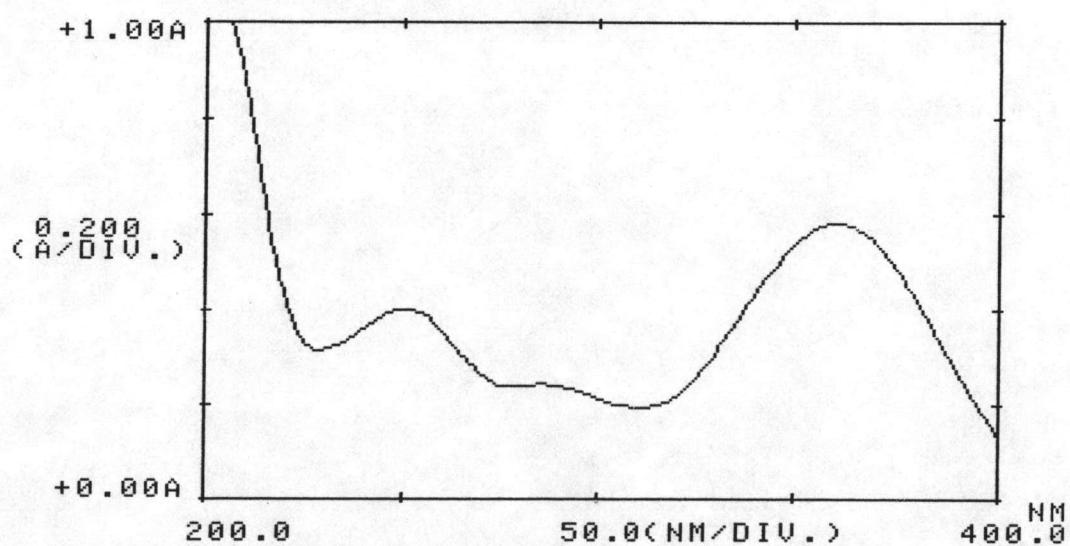

The data of relationship between concentration and absorbance of piroxicam in water and 0.9% sodium chloride solution at 360 nm are presented in Tables b5-b6, and the calibration curves of piroxicam in these mediums are illustrated in Figures b8-b9, respectively.

**Figure b1.** The UV spectrum of diltiazem hydrochloride in water.

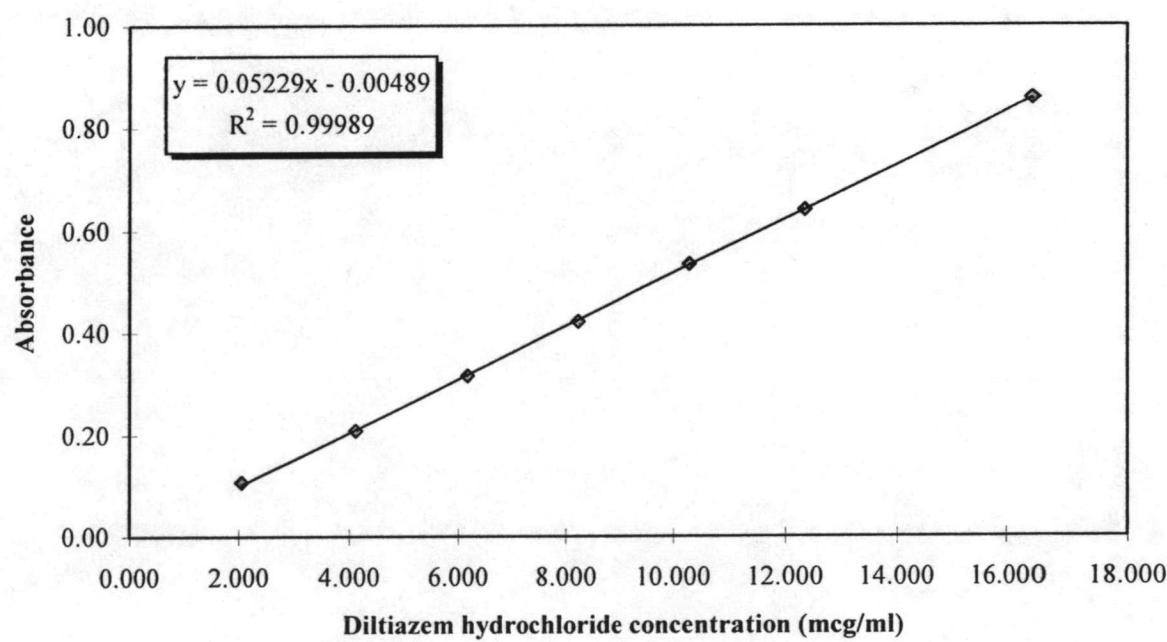

**Figure b2.** The UV spectrum of theophylline in water.

**Figure b3.** The UV spectrum of piroxicam in water.

## B2. The high performance liquid chromatography method

### *Validation for the quantitative determination of ibuprofen by HPLC*

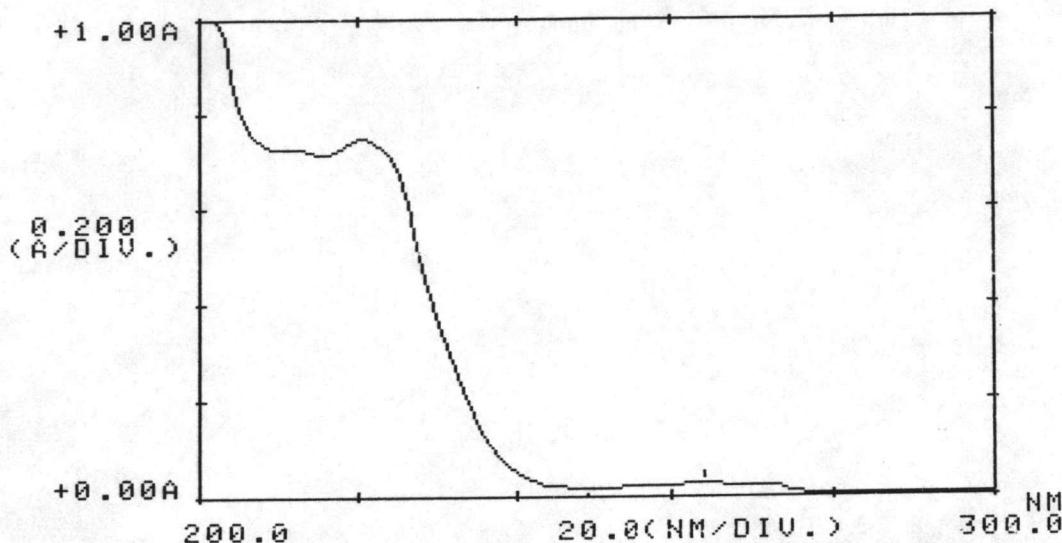

The ibuprofen concentrations for the percentage of drug loading and drug release testing could be determined by HPLC assay with UV detection. The wavelength used to analyze ibuprofen in this study was 220 nm which was the  $\lambda_{\text{max}}$  of ibuprofen in this mobile phase as shown in Figure b10. The validation of the HPLC method used are presented as follows:

#### **1 Specificity**

Figure b11 shows the chromatograms of water, 0.9% sodium chloride solution, ibuprofen solution, internal standard solution and supernatant of blank preparation. Ibuprofen was eluted as a distinct peak with a retention time of 6.39 minutes. This peak was not interfered by the peak of internal standard which had a retention time of 9.51 minutes and the peaks of solvent which had a retention time of 1.73–3.21 minutes. And the supernatant of blank preparation had no peak that interfere the ibuprofen and internal standard peaks when was injected in the same condition. These results indicated that the peak of ibuprofen was not interfered with the peaks of internal standard and other components in the sample.

#### **2 Precision**

Tables b7-b8 show data of within run precision and between run precision of ibuprofen assayed by the HPLC method, respectively. The percentage of coefficient of variation (%CV) values of peak area ratios in both within run and between run precisions were low (0.14–2.20% and 0.25–0.90%, respectively) which indicated that the HPLC methods could be used to determine the amount of ibuprofen over a period of time studied.

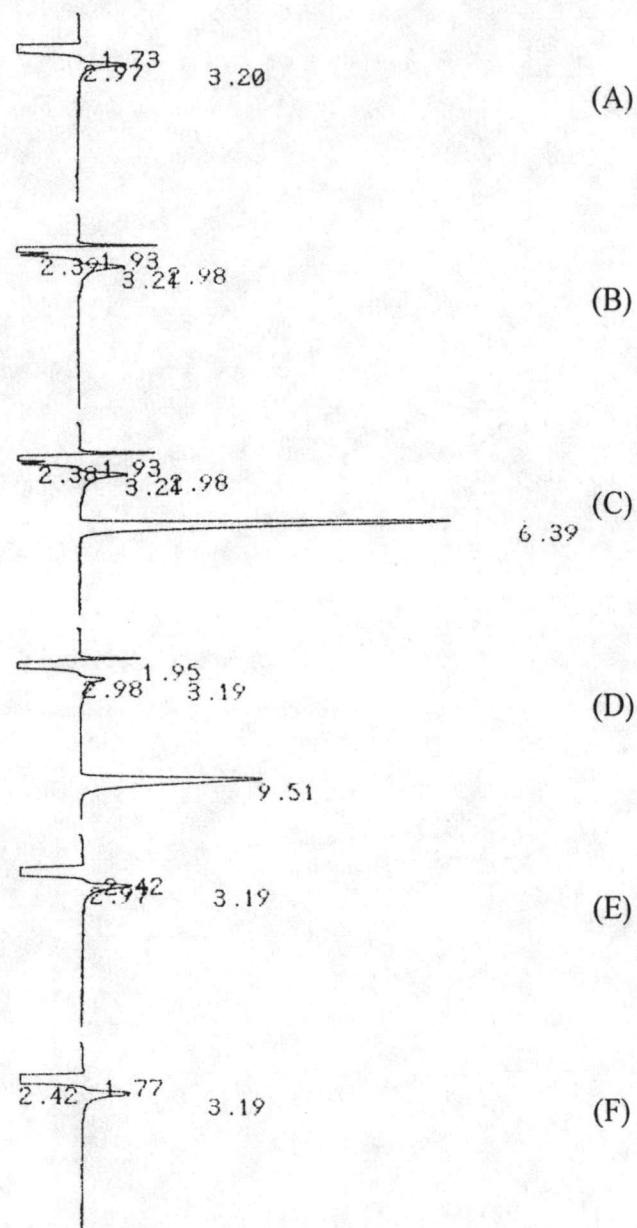

**Figure b10.** The UV spectrum of ibuprofen in mobile phase.

### 3 Accuracy

Table b9 shows the percentage of analytical recovery in each concentration of ibuprofen. The mean percent recovery was 100.08% and the %CV value of percent recovery was very low (0.77%) which indicated that the HPLC method could be used to accurately determine ibuprofen within the concentration range studied (0.5–25 µg/ml).

### 4 Linearity

The Chromatograms of standard solutions are shown in Figure b12. The retention times of ibuprofen and mefenamic acid were about 6.29 - 6.37 and 9.33 - 9.52 minutes, respectively. The calibration curve was plotted between the peak area ratios of ibuprofen to mefenamic acid and the concentrations of ibuprofen in µg/ml. The results are shown in Tables b10-b12 and Figures b13-b15. Linear regression analysis was performed with the coefficient of determination ( $R^2$ ) of 0.99990-0.99999. These results indicated that the HPLC method was acceptable for quantitative analysis of ibuprofen.

**Figure b11.** The HPLC chromatograms of (A) water; (B) 0.9% sodium chloride solution; (C) ibuprofen; (D) internal standard; and supernatant of blank preparation from (E) formulation 5%TP+3%P407; and (F) formulation 5%TP+2%EL.

## **APPENDIX C**

### **Solubility of drugs**

The drugs solubility was experimentally determined since the type and temperature of medium can affect to solubility of them. The saturated solubility of diltiazem hydrochloride, theophylline, piroxicam, and ibuprofen in de-ionized water and 0.9% sodium chloride solution was determined by continuous shaking of excess amount of drugs in each vehicle at 37°C. The sample was removed at appropriate time intervals and was filtered to separate drug particles. The filtrate was appropriately diluted and analyzed by UV-visible spectrophotometric method for diltiazem hydrochloride, theophylline, and piroxicam, and by HPLC method for ibuprofen.

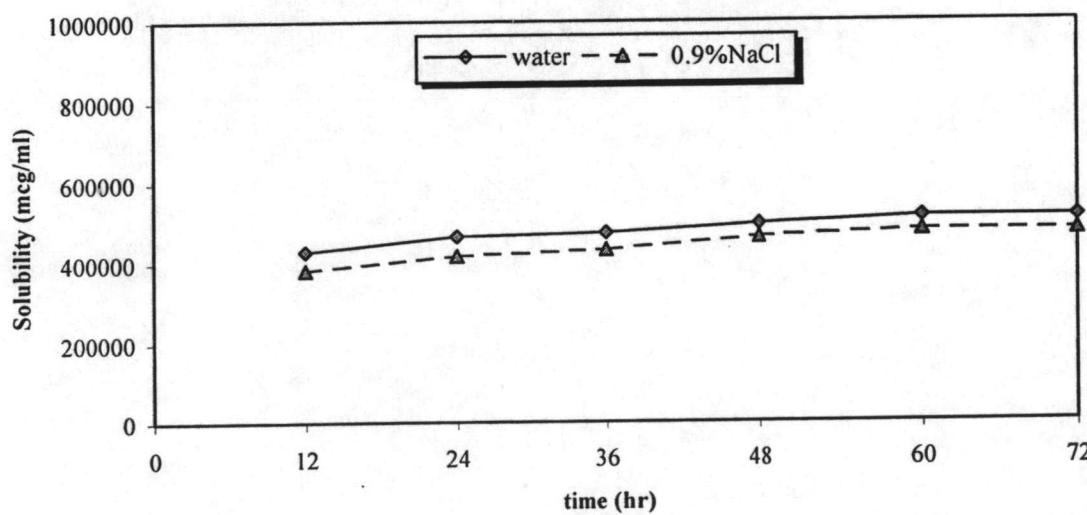

The results of the solubility of drugs are as follows:

**Table c1.** Solubility of diltiazem hydrochloride in water at 37°C.

5	0.059	0.077	X	1.000	0.655
6	0.769	0.126	X	1.000	0.998
7	0.986	0.126	X	1.000	0.965
8	X	1.000	X	X	0.655
9	1.000	1.000	X	1.000	1.000
10	X	X	X	X	1.000

**Note:** X means the % transmittance of fat emulsion from two parameter levels is significant difference at 95% confidence level.

The numbers in the table are the p-values from the ANOVA that mean the % transmittance of fat emulsion from two parameter levels is not different at 95% confidence level.

## APPENDIX E

### Particle size determination of SLN

The particle size of SLN was determined by Mastersizer S. It is a range of laser light scattering based particle sizers (Mastersizer particle size analyzer, Instrumental manual). The results reported by them are a number of fundamental concepts follow as:

- The result is volume based.
- The result is expressed in terms of equivalent spheres.
- The analyzed distribution is a set of size classes which the representative diameter for each class is taken to be the geometric mean of the size band limits:

$$\bar{d} = \sqrt{d_{i-1} d_i} \quad (9)$$

The result from the analysis is the relative distribution of volume of particles in the range of size classes. From this basic result the statistics of the distribution are calculated. Moreover, the span and uniformity are calculated for describes the distribution of the particles. The span gives a description of the width of the distribution which is independent of the median size. The uniformity is a measure of the absolute deviations from the median.

The derived diameters are defined as:

$$D[m,n] = \left[ \frac{\sum V_i d_i^{m-3}}{\sum V_i d_i^{n-3}} \right]^{\frac{1}{m-n}} \quad (10)$$

Where

- $V_i$  is the relative volume in class  $i$  with mean class diameter of  $d_i$ .
- $m$  and  $n$  are integer values which describe the type of derived diameter.
- $D[4,3]$  is the volume weighted mean.
- $D[3,2]$  is the surface weighted mean.

The span of the distribution is defined as:

$$Span = \frac{d(v, 0.9) - d(v, 0.1)}{d(v, 0.5)} \quad (11)$$

The uniformity of the distribution is defined as:

$$Uniformity = \frac{\sum X_i [d(v, 0.5) - d_i]}{d(v, 0.5) \sum X_i} \quad (12)$$

Where

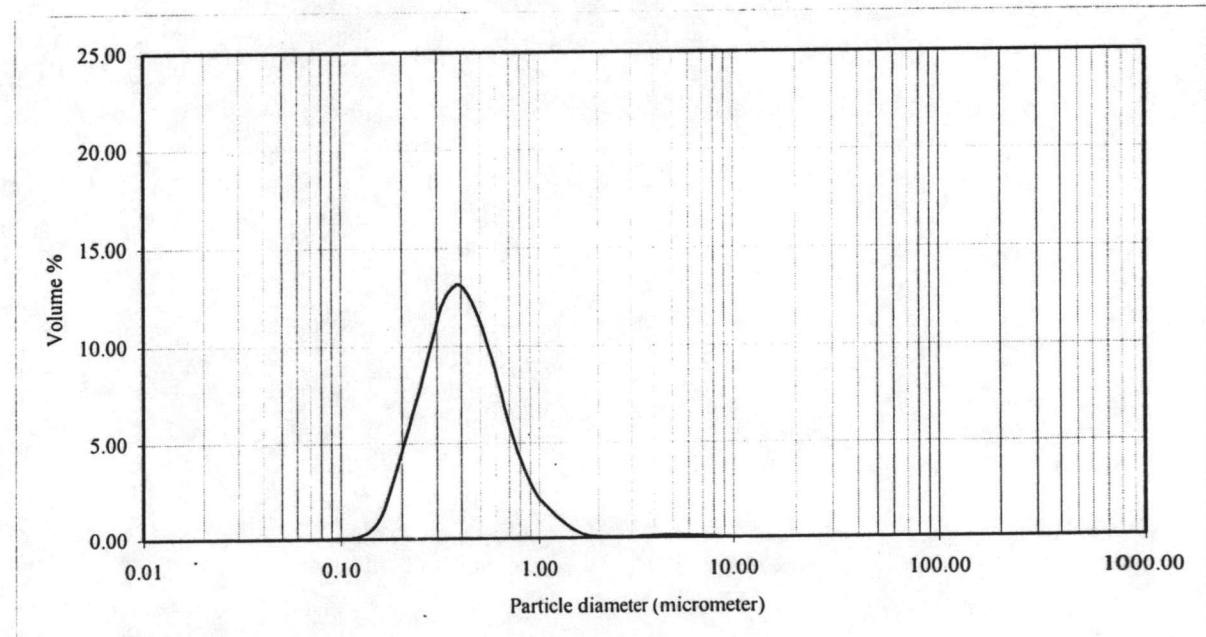

$d(v, 0.5)$  is the median size of the distribution.

$d_i$  and  $X_i$  are respectively the mean diameter of, and result in, size class  $i$ .

The examples of particle size determination of SLN are in Tables e1–e3 and Figures e1–e3. These data were average from three determinations.

## APPENDIX F

### Zeta potential of SLN

The surface forces effects in the controlling the behavior of colloidal systems. This force is much more important than the gravity effects. The Zeta-meter system 3.0 can measure the effect of electrostatic charge of the particle which causes the electrical repulsion between adjacent particles and the attractive force (called the van der Waals force). The net result depends on the relative magnitude of both forces. Numerous encounters occur between particles as they are moved about by mechanical agitation, convection currents and Brownian motions. The outcome of these collisions will depend in part on the net attractive or repulsive force between the colloids. This charge produces a difference in electrical potential, in millivolts, between the surface of each colloid and the bulk of the suspending liquid. This difference is called the zeta potential.

The Zeta meter system 3.0 is an instrument for zeta potential measurement. The concept of this instrument is the charged colloid will move when the suspension is placed between two electrodes that have a DC voltage across them, and its velocity (called electrophoresis mobility) will be proportional to the zeta potential. This phenomena is known as electrophoresis.

The Helmholtz-Smoluchowski equation is the most elementary expression for zeta potential. The basic formula shows a direct relation between zeta potential and electrophoresis mobility as follows: (Martin, 1993; Muslin Limpanasitthikul, 1991)

$$\zeta = \frac{v}{E} \times \frac{4\pi\eta}{\epsilon} \times (9 \times 10^4) \quad (13)$$

Where:  $\zeta$  = Zeta potential of the suspened particle in volts

$v$  = The velocity of migration in cm/sec

$E$  = The potential gradient in volts/cm

$\eta$  = The viscosity of the medium in poise (dyne sec/cm<sup>2</sup>) at temperature t

$\epsilon$  = The dielectric constant of the medium

The term  $v/E$  means the electrophoresis mobility ( $EM$ ). This is determined by the Zeta meter system 3.0 in microns/sec per volts/cm. So it is preferable to calculate the zeta potential in practical millivolts, the formula then becomes: (Zeta meter system 3.0, Instrumental manual)

$$\zeta = 113,000 \times \frac{\eta}{\epsilon} \times EM \quad (14)$$

Where:  $\zeta$  = Zeta potential of the suspended particle in millivolts  
 $EM$  = The electrophoresis mobility at actual temperature in microns/sec per volts/cm

Table f1.describes the interaction between zeta potential determinations and the probable response of the suspension being tested.

**Table f1.** The interaction between zeta potential determinations and the probable response of the suspension being tested (from the Zeta meter system 3.0 manual)

Stability characteristics	Average ZP in millivolts
Maximum agglomeration and precipitation	+3 to 0
Excellent agglomeration and precipitation	-1 to -4
Fair agglomeration and precipitation	-5 to -10
Threshold of agglomeration (agglomerates of 2 to 10 colloids)	-11 to -20
Plateau of slight stability (few agglomerates)	-21 to -30
Moderate stability (no agglomerates)	-31 to -40
Good stability	-41 to -50
Very good stability	-51 to -60
Excellent stability	-61 to -80
Maximum stability	-81 to -125

## APPENDIX G

### Viscosity of SLN

Viscosity and flow behavior are important properties of a material and can be measured by various techniques with a variety of instruments. Haake Rotovisco RV20 is one of the rotational viscometers with coaxial cylinder sensor systems. The inner cylinder (called rotor) rotates at a defined speed, and the outer cylinder (called cup) is held at rest. The rotating inner cylinder forces the liquid in the annular gap to flow. The resistance of the liquid being sheared between the stationary and rotating boundaries results in a viscosity related torque working on the inner cylinder which counteracts the torque provided by the drive motor. This measured torque is proportional to shear stress (Haake Rotovisco RV20, Instrument manual; Schramm, 1981).

The definition of the viscosity is proportional to shear stress or resistance to flow at a defined speed or shear rate.

$$\eta = \frac{\tau}{D} \quad (15)$$

Where:  $\eta$  = Viscosity in Pascal-second

$\tau$  = Shear stress in Pascal (newton/m<sup>2</sup>)

$D$  = Shear rate in per second

In this study, NV sensor was used to measure in all preparations. This sensor measures the low viscosity sample in the range 1-10,000 mPa.s. The volume of sample used to measure is 9 ml, and the gap between the stationary and rotating boundaries is 0.35 mm.
