APPENDICES

Appendix A

Reagents preparation[66]

		Sterilization	Storage
Lysis buffer I		Autoclaving	4 degree C
109.54 g	Sucrose		
10 ml	Tris-HCl 1M		
5 ml	MgCl ₂ 1M		
10 ml	Pure Triton-X 100		
655 ml	ddH ₂ O		
<u>1 M Tris-HCl</u>		Autoclaving	room temp.
24.228 g	Tris-base (121.14 g/mol)		
add 150 ml H ₂ O , adjust pH to 7.5 by conc HCl			
adjust to 200 ml with ddH ₂ O			
<u>1 M MgCl₂ * 6H₂O</u>		Autoclaving	room temp.
20.33 g	MgCl ₂ *6H ₂ O (203.30 g/mol)		
adjust to 100 ml with ddH ₂ O			
Lysis buffer II		Autoclaving	room temp.
15 ml	5.0 M NaCl		
48 ml	0.5 M EDTA		
937 ml	ddH ₂ O		
<u>5 M NaCl</u>		Autoclaving	
4.383 g	NaCl (58.44 g/mol)		
0.5 M EDTA (pH 8.0)		Autoclaving	
Phenol-chloroform-IAA (25:24:1)		(dark glass bottle)	4 degree C
400 ml	Phenol		
384 ml	Chloroform		
16 ml	Isoamyl alcohol		
7.5 M Ammonium acetate		filtration 0.2 micron	room temp.
57.81 g	Ammonium acetate (7.708 g/mol)		
adjust to 100 ml with ddH ₂ O			
Proteinase K (20 mg/ml)			-20 degree C
100 mg + ddH ₂ O 5 ml			
10% SDS	(stock 30 ml)	-	room temp.
5 g	SDS		
add 40ml H ₂ O, heat at 68 degree C then adjust to pH 7.2			
by conc. HCl , adjust to 50 ml with ddH ₂ O			

Appendix B

Genotyping analysis

Cytochrome P450 2C9 polymorphisms and VKORC1 genotypes were analyzed by Real time PCR, LightCycler® which is based on the principle of Fluorescence Resonance Energy Transfer (FRET)

The melting curve chart shows fluorescence (Y-axis) and temperature (X-axis) while the melting peak chart plots the first negative derivative of the fluorescence ($-d/dT$) versus temperature, and shows the melting temperature of each sample as a peak. Therefore, sample in different genotype will shows in different peak.

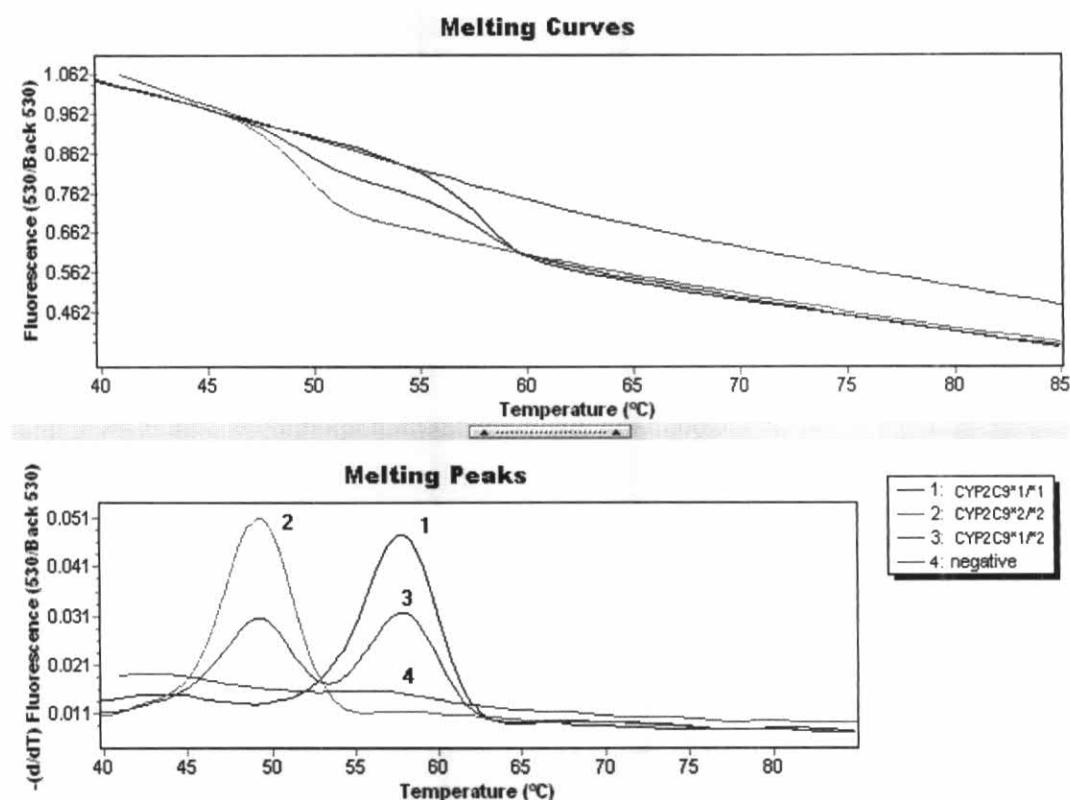

Figure 1 Melting curve and melting peaks chart of CYP2C9*2

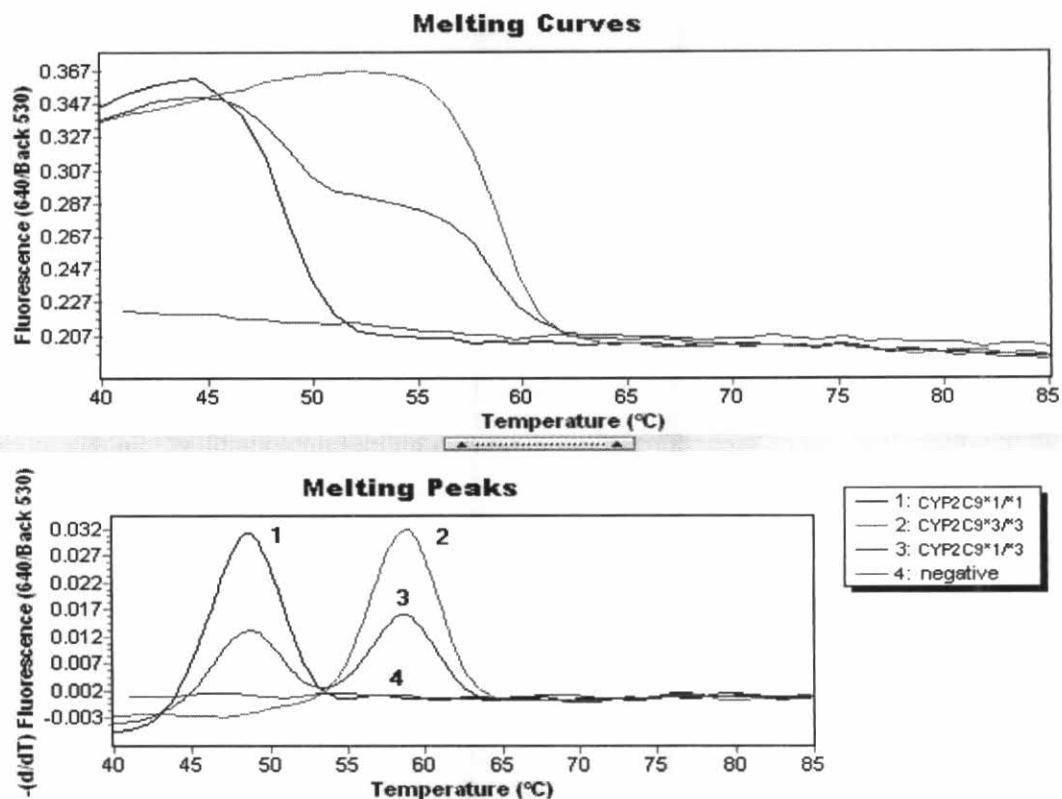

Figure 2 Melting curve and melting peaks chart of CYP2C9*3

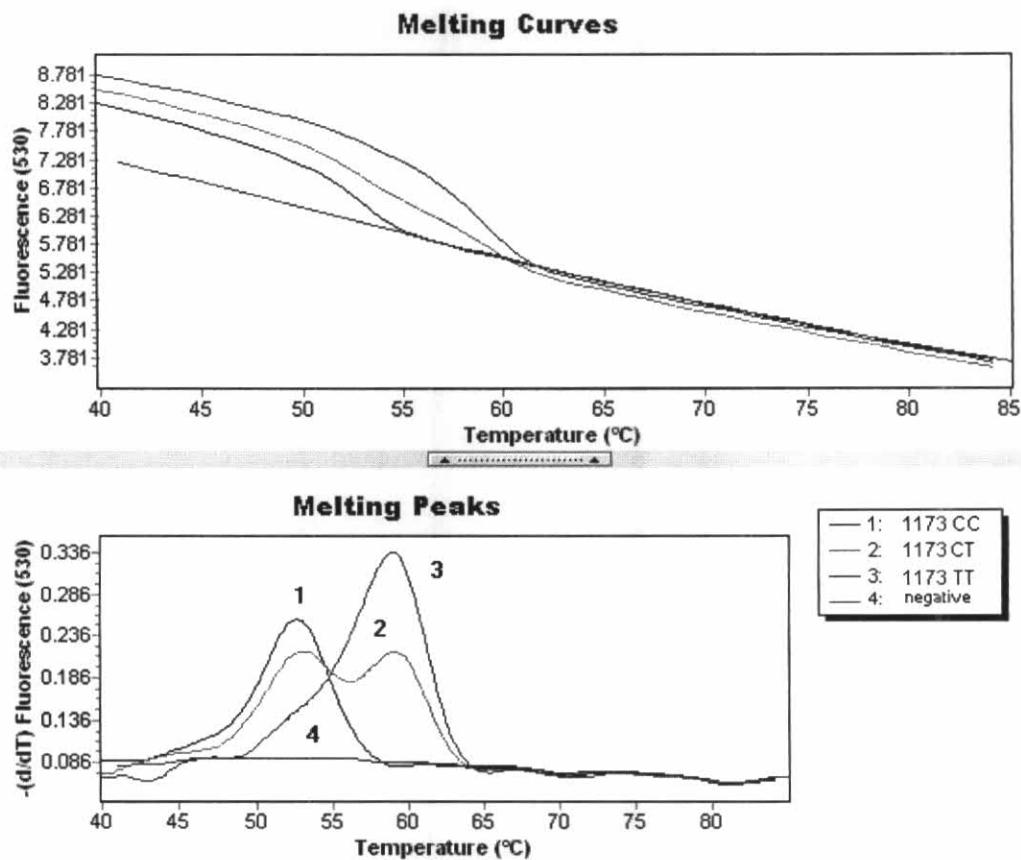

Figure 3 Melting curve and melting peaks chart of VKORC1 C1173T

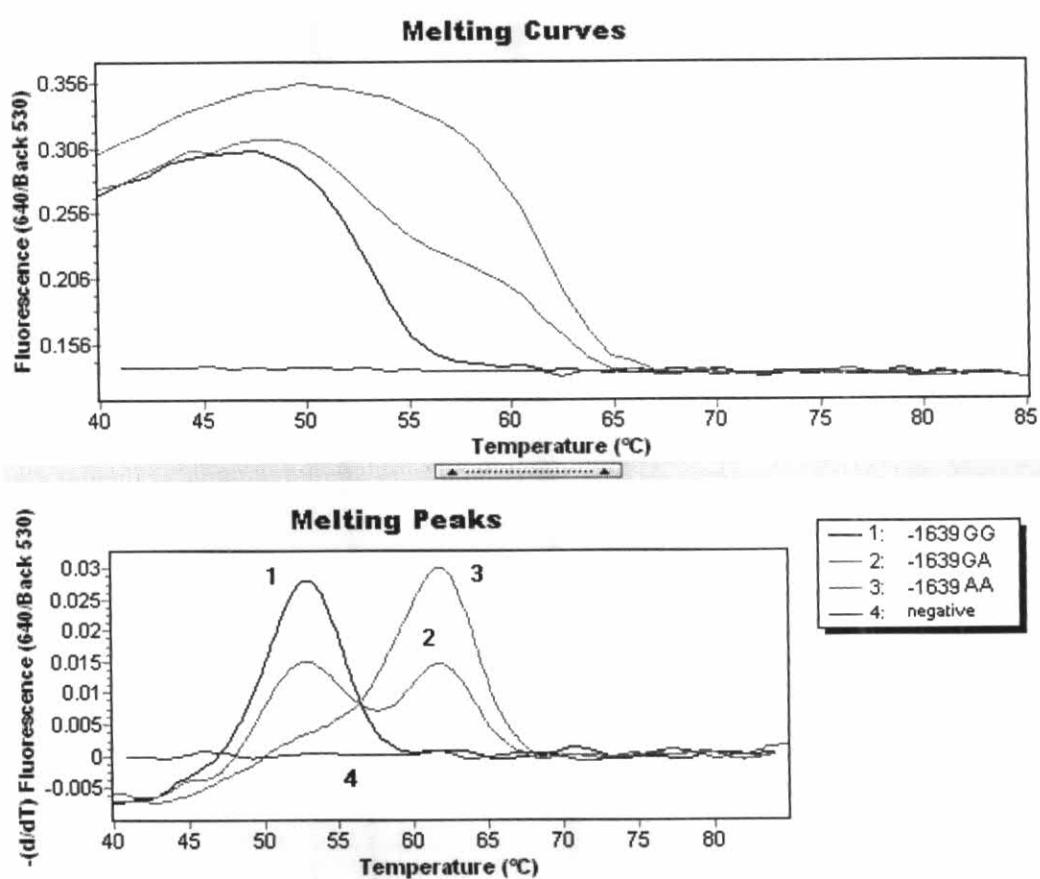

Figure 4 Melting curve and melting peaks chart of VKORC1 G-1639A

Appendix C

Validation of analytical method for warfarin concentration

Total plasma warfarin concentration was determined by using High-Performance Liquid Chromatography with UV detection.

1. Calibration curve and linearity

The linearity of calibration curve was determined from six standard plasma solutions (150, 200, 500, 1000, 1500 and 3000 ng/mL) of racemic warfarin. The calibration curve is shown in Figure 5. The warfarin concentration has been related to the peak height ratio and gave a better R^2 than those of peak area ratio. The least squares linear regression equation was

$$y = 0.0012x + 0.0463, R^2 = 0.9998$$

Where ; x = Plasma drug concentration
 y = Peak height ratio of drug to internal standard (IS)
 R^2 = Coefficient of determination

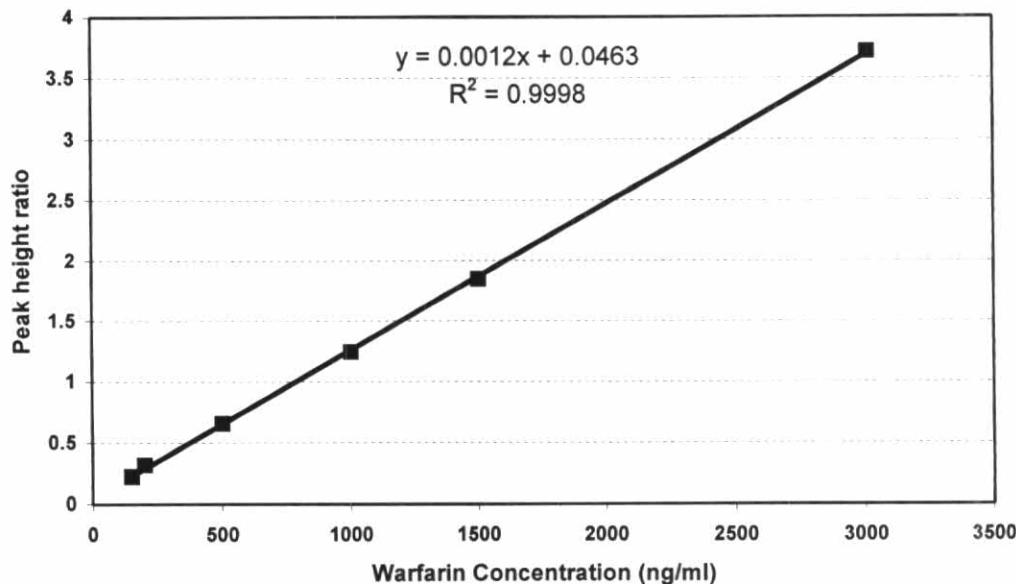

Figure 5 Calibration curve of warfarin

2. Specificity and selectivity

Chromatograms of drug-free plasma and spiked plasma are demonstrated in Figure 6. No interference from endogenous substances in plasma was observed.

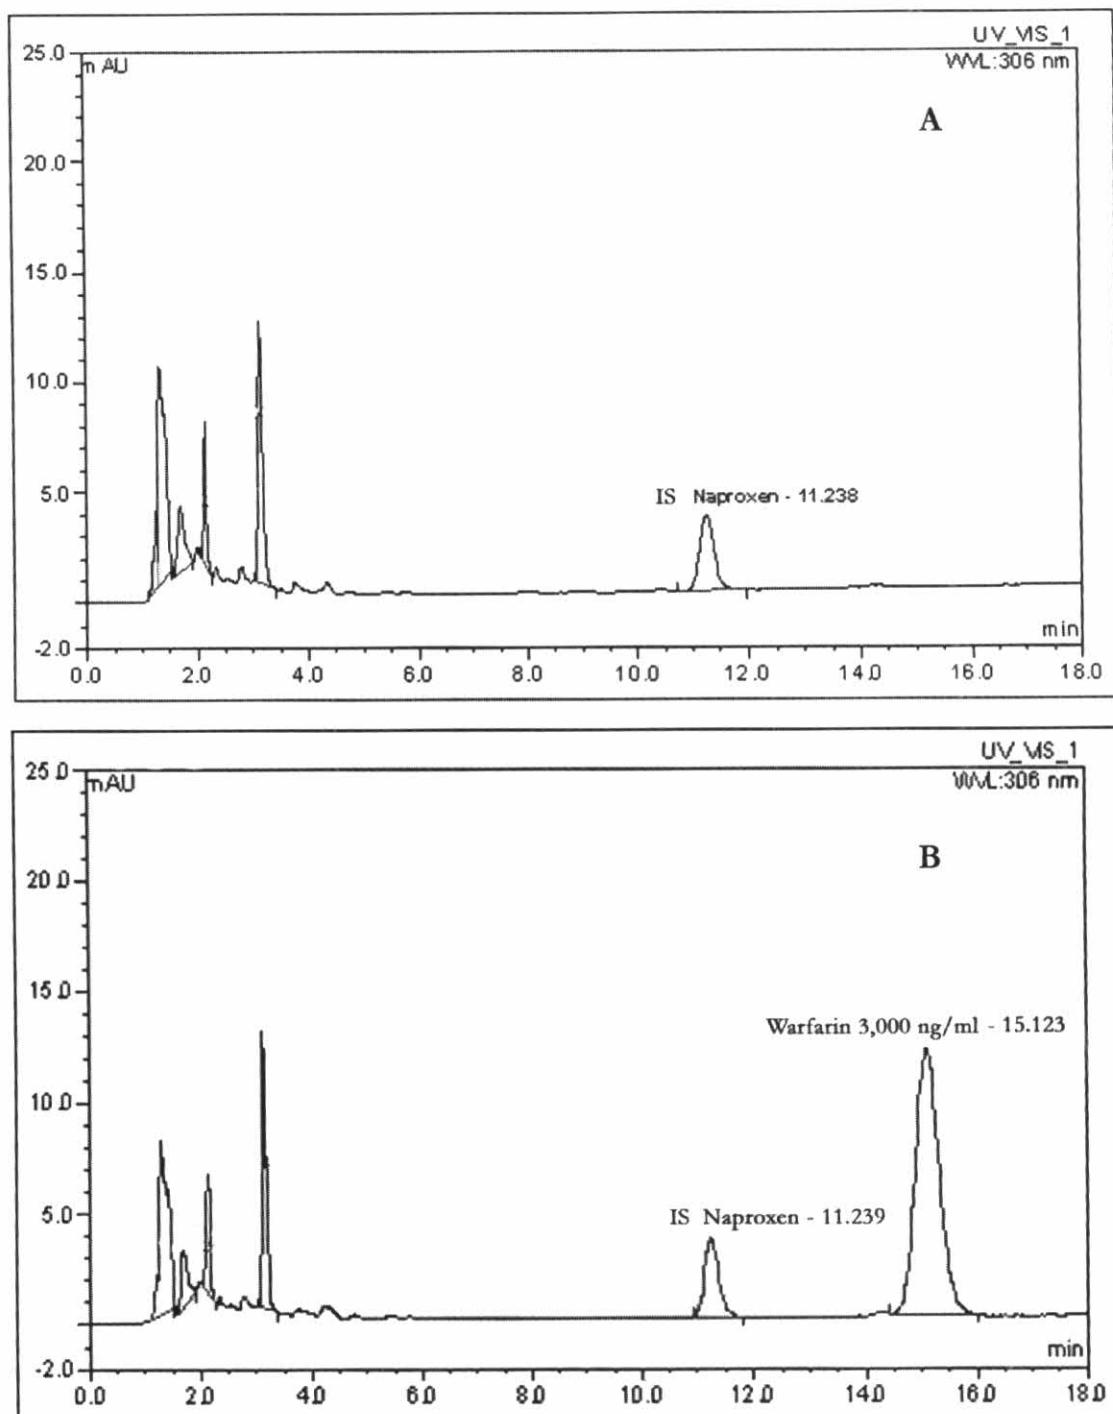

Figure 6 (A) Chromatogram of extracted blank plasma. (B) Chromatogram of Spiked plasma with warfarin 3,000 ng/mL and internal standard (IS).

3. Limit of quantification

Limit of quantification (LLOQ) was the lowest concentration on the calibration curve which had linear relationship with peak height ratio and had acceptable accuracy and precision within $\pm 20\%$ (%RD; percent deviation from the nominal concentration = 2.47% and %CV; coefficient of variation = 3.64 %). Chromatogram of spiked plasma for 150 ng/mL (LLOQ) is demonstrated in Figure 7.

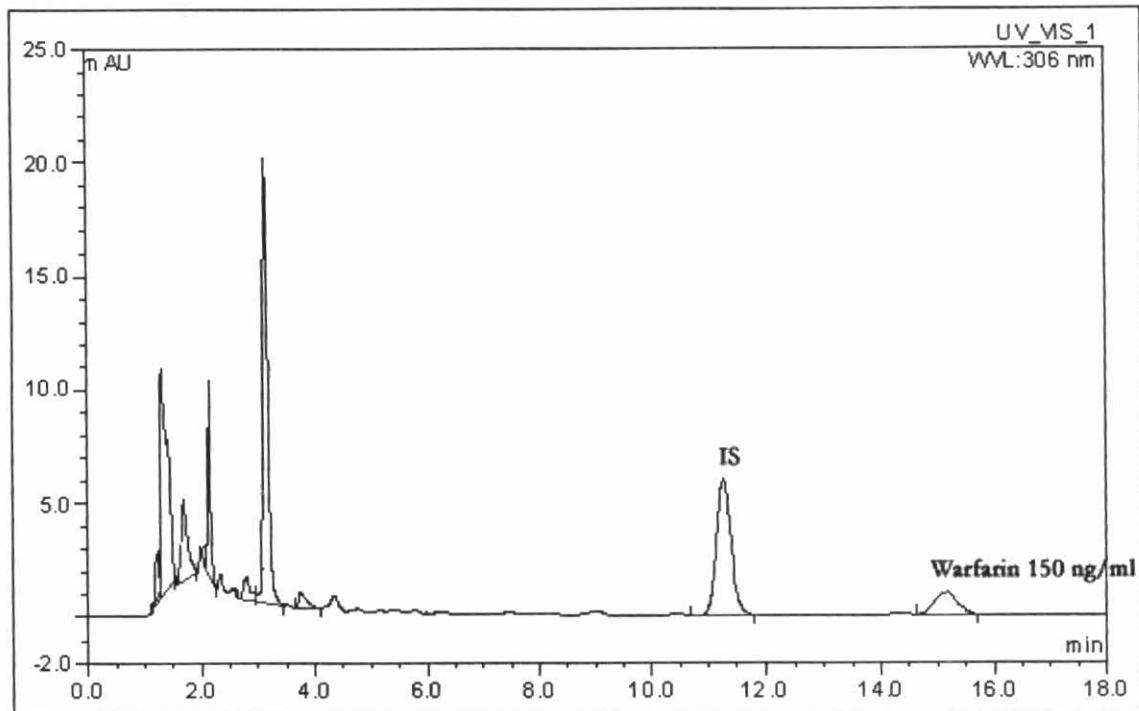

Figure 7 Chromatogram of spike plasma of IS (Naproxen) and Warfarin 150 ng/mL.

4. Accuracy, precision and recovery

The precision and accuracy of the assay procedure were evaluated from %CV and %RD, respectively. As shown in Table 1, the precision and accuracy of intra-day and inter-day were all in acceptable range (within $\pm 15\%$ for QCL, QCM and QCH, and $\pm 20\%$ for LLOQ). Recovery of extracted warfarin was approximately 65 %.

Table 1 Accuracy , precision and recovery of spiked plasma of warfarin

QCs	Acceptable limit ($\pm\%$)	Conc. (ng/mL)	Intraday (n=5)		Interday (n=15)		Recovery of drug*	Recovery of IS*
			Precision (%)	Accuracy (%)	Precision (%)	Accuracy (%)		
LLOQ	20	150	3.64	2.47	5.34	-1.98	-	-
QCL	15	300	3.69	-2.91	2.79	-1.57	57.058	64.811
QCM	15	800	6.35	3.55	6.18	0.68	66.596	68.247
QCH	15	2000	5.03	2.30	3.18	2.18	61.472	68.676

* compare with solution

5. Stability

The stability of warfarin in sample plasma and extracted samples at various conditions were determined (Table 2). The stability of warfarin of QCL and QCH were higher than 90% except in freeze-thaw stability of QCL. Acceptable warfarin stability was demonstrated for all phases of storage and processing.

Table 2 Stability of warfarin in sample plasma and final extracted

Condition	Stability (%)	
	QCL (300 ng/ml)	QCH (2,000 ng/ml)
Short – term stability		
- 10 hr at room temperature	102.54	96.70
Long -term stability		
- 3 months in -20°C	97.11	95.76
Final extraction stability		
- in autosampler for 6 hr	101.33	101.67
Freeze-thaw stability		
- 3 cycles	72.62	93.99
