Thesis Title A Taxonomic Study of Khao Yai Culex Mosquitoes.

Name Miss Thasnee Boonkong Department of Biology

Academic Year 1968

Abstract

The Culex Mosquitoes found at Khao Yai during the study period were altogether 12 species, represented 6 subgenera. The diagnostic characters of subgenera and species used were those described by Bram (1967). Identification of each species was based largely on the characters of larvae and male genitalia. The study has also included larval and pupal chaetotaxy in preparation for further studies.

Culex found were Culex (Culex) mimulus, Culex (Culex) sinensis, Culex (Culex) pseudovishnui, Culex (Culex) perplexus, Culex (Culex) pipiens quinquefasciatus; Culex (Culiciomyia) pallidothorax; Culex (Lutzia) halifaxii; Culex (Lophoceraomyia) ganapathi, Culex (Lophoceraomyia) minor, Culex (Lophoceraomyia) infantutus; Culex (Mochthogenes) foliatus, Culex (Mochthogenes) malayi; Culex (Neoculex) brevipalpis, and so far unidentified 5 species. Discussion on some structural observations have also been attempted.

Acknowledgement

The author wishes to express her thanks to Professor Dr. Kloom Vajropala for his supervision. Very sincere thanks are due to Dr. Sunthorn Sirivanakarn for his advice and encouragement on this study. The author is very much indebted to Dr. Prasit Tansathit for his helpful criticisms and suggestions in preparing the manuscript. The author also wishes to thank Dr. Pensri Kuptavanij for consultation in some phases of work during this study.

The author wishes to express her thanks to The Department of Royal Forestry for providing facilities of the field work.

This investigation was partly financed by the Graduate School, Chulalongkorn University, the author also expresses her gratitude to this Department.
