Plant material for tissue culture

The explants were excised from internode for 2-3 nodes with 3-4 cm. long per pieces. Explants were surface sterilized with distilled water 30 min and shaken in distilled water for 30 min. Clean with 10%(v/v) Clorox containing tween20 2-3 drops and shaked with magnetic stirrer 30 min for 3 times. In addition, they were disinfected in 70%(v/v) Ethyl alcohol and tween20 2-3 drops for 1-3 min. In laminar flow cabinet, they continued soaking in 10%(v/v) Clorox with tween20 2-3 drops for 30 min. Followed by rising with sterile distilled water for 5 times. Finally, cleaned explants were cut for 1-2 node with 1-2 cm. long per pieces.
