APPENDIX

A1. Calculation of crystallinity by using DSC

The crystallinity of nanocomposite polypropylene sample were calculated by using the following equation.

$$\text{Crystallinity (\%)} = \left[\frac{\Delta H_f}{\Delta H_f^*} \right] \times 100$$

where ΔH_f is the heat of fusion of the sample (J/g) determined from DSC curve and ΔH_f^* is the heat of fusion of the 100 % crystalline polypropylene.

A2. Data for the interlayer spacing of modified silicate clay for the influence of stirring time on the grafting condition
