COORDINATION BETWEEN CENTRAL AND LOCAL CONTROL OF PHOTOVOLTAIC GENERATION SYSTEM FOR CONTROLLING VOLTAGE VIOLATION AND UNBALANCE IN DISTRIBUTION SYSTEMS) อ.ที่

ปรึกษาหลัก : ผศ. ดร.สุรชัย ชัยทัศนีย์

พลังงานแสงอาทิตย์เป็นพลังงานที่สะอาดและไม่ก่อมลพิษให้กับสิ่งแวดล้อม ประกอบกับในหลายๆ ประเทศมีการขยายตัวทางเศรษฐกิจ ทำให้ประเทศเหล่านั้นมีความต้องการใช้ไฟฟ้าเพิ่มมากขึ้น และมีการสนับสนุนให้มีการติดตั้งระบบผลิตไฟฟ้าจากพลังงานแสงอาทิตย์เพิ่มขึ้น โดยเฉพาะอย่างยิ่งในระบบแรงดันต่ำเนื่องจากภาคครัวเรือนมีศักยภาพเพียงพอที่จะติดตั้งระบบผลิตไฟฟ้าจากพลังงานแสงอาทิตย์ได้ ประกอบกับค่าบำรุงรักษาและค่าการติดตั้งในปัจจุบันมีราคาต่ำลง อย่างไรก็ตามเมื่อมีระบบผลิตไฟฟ้าจากพลังงานแสงอาทิตย์เพิ่มขึ้นในระบบแรงดันต่ำย่อมเกิดผลเสียต่อระบบแรงดันต่ำได้ อันประกอบด้วย (1) การสูญเสียกำลังการผลิต เนื่องจากระบบป้องกันแรงดันไฟฟ้าเกินของระบบผลิตไฟฟ้าจากพลังงานแสงอาทิตย์ทำงาน โดยเฉพาะระบบผลิตไฟฟ้าจากพลังงานแสงอาทิตย์ที่อยู่ปลายสาย และ (2) ความไม่สมดุลของแรงดันไฟฟ้าในแต่ละเฟส เนื่องจากการติดตั้งระบบผลิตไฟฟ้าจากพลังงานแสงอาทิตย์แบบเฟสเดียว

ระบบผลิตไฟฟ้าจากพลังงานแสงอาทิตย์ในงานวิจัยฉบับนี้จะพิจารณาเฉพาะระบบผลิตไฟฟ้าจากเซลล์แสงอาทิตย์ (PV System) เท่านั้นและเพื่อแก้ไขปัญหาที่เกิดขึ้นต่อระบบแรงดันต่ำดังกล่าวข้างต้น จึงจะได้ประยุกต์ใช้การควบคุมระบบผลิตไฟฟ้าจากเซลล์แสงอาทิตย์ เพื่อให้สามารถรองรับการเพิ่มการเชื่อมต่อกับระบบแรงดันต่ำได้ โดยการควบคุมดังกล่าวจะอาศัยการทำงานประสานกันระหว่างศูนย์ควบคุมกลาง (Central Control) และศูนย์ควบคุมส่วนท้องถิ่น (Local Control) ของระบบผลิตไฟฟ้าจากเซลล์แสงอาทิตย์ ศูนย์ควบคุมกลางทำหน้าที่หาค่าพารามิเตอร์ให้กับศูนย์ควบคุมส่วนท้องถิ่น โดยพิจารณาจาก (1) ระบบผลิตไฟฟ้าจากเซลล์แสงอาทิตย์จะต้องจ่ายกำลังไฟฟ้าจริงที่ค่าสูงสุด และ (2) ภายใต้สภาวะความไม่แน่นอนในระบบแรงดันต่ำจะต้องไม่ทำให้เกิดแรงดันเกิน โดยอาศัยวิธีการหาค่าเหมาะสมด้วยการเคลื่อนที่ของอนุภาคแบบ 2 ชั้น (2-stage Particle Swarm Optimization (PSO)) ส่วนศูนย์ควบคุมส่วนท้องถิ่นจะรับค่าพารามิเตอร์เพื่อนำมาใช้กับสมการ $P(U)$ และ $Q(U)$ Function โดยสมการ $P(U)$ Function ใช้ในการปรับกำลังไฟฟ้าจริงและ $Q(U)$ Function ใช้ในการปรับกำลังไฟฟ้าเสมือนที่ได้จากระบบผลิตไฟฟ้าจากเซลล์แสงอาทิตย์เมื่อแรงดันที่จุดติดตั้งเปลี่ยนแปลงไป ในวิทยานิพนธ์ฉบับนี้ การแก้ปัญหาการไหลของกำลังไฟฟ้าควบคู่กับสมการ $P(U)$ และ $Q(U)$ Function จะอาศัยวิธีนิวตันราฟสัน (Newton-Raphson Method) โดยพิจารณาควบคู่กับการปรับระยะการก้าวของวิธีนิวตันราฟสัน (Step-length Adjustment) ระบบทดสอบที่ใช้จะเป็นระบบแรงดันต่ำที่มี 19 และ 29 จุดโหลด และผลลัพธ์ที่ได้สามารถแสดงให้เห็นว่า ค่าพารามิเตอร์ที่ได้จากศูนย์ควบคุมกลางสามารถทำให้ศูนย์ควบคุมส่วนท้องถิ่นทำงานได้อย่างมีประสิทธิภาพภายใต้สภาวะความไม่แน่นอนในระบบแรงดันต่ำ

KEYWORD: LV distribution system, Loss of real power generation, Voltage unbalance, PV system, Central control, Local control, PSO

Anuwat Chanhome : COORDINATION BETWEEN CENTRAL AND LOCAL CONTROL OF PHOTOVOLTAIC GENERATION SYSTEM FOR CONTROLLING VOLTAGE VIOLATION AND UNBALANCE IN DISTRIBUTION SYSTEMS. Advisor: Asst. Prof. SURACHAI CHAITUSANEY, Ph.D.

Solar energy is a clean and pollution-free energy. Economic growth has led to increased demand for electricity in many countries, which has encouraged the installation of solar power generation systems, especially in LV distribution system. Households have the potential to install solar power generation systems because the costs of installation and maintenance have been continuously decreased. However, when there are many connected solar power generation systems in LV distribution system, the following problems may occur: (1) Loss of real power generation due to the operation of overvoltage protection of solar power generation systems, especially the ones on downstream nodes and (2) Voltage unbalance due to the connection of single-phase solar power generation system.

In this dissertation, solar power generation system is determined as only Photovoltaic (PV) system. To cope with the above mentioned problem in LV distribution systems, this dissertation applies a control strategy to support high PV penetration which is the coordination between central and local controls. Central control is used to assess parameter setting for local control by considering the following principles: (1) the total connected PV system must inject real power output at the maximum value and (2) the parameter setting result must not cause voltage violation under uncertainty condition in LV distribution system. 2-stage Particle Swarm Optimization (PSO) is applied in central control for the parameter assessment of local control. The parameter setting will be sent to local control which consists of P(U) and Q(U) functions. P(U) and Q(U) functions are used for real and reactive power output adjustment from connected PV system respectively. The operation of P(U) and Q(U) functions will be regulated when the voltage at the connection point of PV system changes. In this dissertation, the power flow algorithm with using local control P(U) and Q(U) functions applies Newton-Raphson Method with step-length adjustment. The test systems are modified 19 and 29 node distribution systems. The power flow results show that the parameter setting obtained from central control enables the local control operate effectively under uncertain conditions in LV distribution systems.

ACKNOWLEDGEMENTS

Firstly, I would like to express my deep sense of gratitude to my advisor, Assistant Professor Dr. Surachai Chaitusaney for providing invaluable guidance, comments and suggestions throughout my PhD course. I am really glad to his dedication and keen interest above all his overwhelming attitude to help his students that had been solely and mainly responsible for completing my work. He helped me to a very great extent to accomplish this dissertation.

I would like to offer my sincere thanks to my thesis examination committee: Associate Professor Dr. Naebboon Hoonchareon, Associate Professor Dr. Kulyos Audomvongseree, Assistant Professor Dr. Surapong Suwankawin and Dr. Predit Fuangfoo.

Finally, I am thankful to my parents who support, encourage and pray for my great success. Their kind blessings and good wishes for me and my future turn everything into easier.

Anuwat Chanhome

LIST OF ABBREVIATIONS

Abbreviations

| | |
|-------|--|
| AEDP | Alternative Energy Development Plan |
| c-Si | Crystalline Silicon |
| DSOs | Distribution System Operators |
| ESS | Energy Storage System |
| FIT | Feed-In-Tariff |
| ICs | Integrated Circuits |
| LV | Low Voltage |
| MEA | Metropolitan Electricity Authority |
| MPP | Maximum Power Point |
| MV | Medium Voltage |
| OLTC | On-Load Tap Changer |
| pc-Si | Poly Crystalline Silicon |
| PEA | Provincial Electricity Authority |
| PSO | Particle Swarm Optimization |
| PV | Photovoltaic |
| SCADA | Supervisory Control and Data Acquisition |

Constant Parameters

| | |
|---------------------|---|
| $D_{\sigma\sigma'}$ | Distance between conductor phase σ and σ' (feet) |
| f | Frequency (Hz) |
| I_{MPP}^0 | MPP current at nominal cell operating temperature (A) |
| I_{SC}^0 | Short-circuit current at nominal cell operating temperature (A) |
| K_i | Current temperature coefficient (A/°C) |
| K_v | Voltage temperature coefficient (V/°C) |
| n | Number of overall nodes in LV distribution system |
| N_{OT} | Nominal cell operation temperature (°C) |
| N_s | Number of PV module |
| p_g | Earth resistivity (Ω -m) |

| | |
|--------------|--|
| r^σ | Resistance of conductor phase σ (Ω) |
| r_c^σ | Radius of conductor of any phase σ (feet) |
| V_{MPP}^0 | MPP voltage at nominal cell operating temperature (V) |
| V_{oc}^0 | Open-circuit voltage at nominal cell operating temperature (V) |

Indices

| | |
|----------|--|
| i | Index of nodes or connection point in distribution system |
| j | Index of nodes in distribution system that connect to node i |
| k | Notation indicates at k^{th} iteration of power flow algorithm |
| h | Notation indicates at h^{th} iteration of power flow algorithm |
| m | Notation indicates real-part value |
| max | Notation indicates maximum value |
| min | Notation indicates minimum value |
| ne | Notation indicates negative sequence |
| npv | Notation indicates the total number of connected PV systems |
| po | Notation indicates positive sequence |
| r | Notation indicates imaginary-part value |
| $rated$ | Notation indicates rated value |
| sch | Notation indicates scheduled value |
| ze | Notation indicates zero sequence |
| σ | Notation indicates any phase A, B or C |

Variables

| | |
|------------------|--|
| GMR^σ | Geometric Mean Radius of conductor phase σ (feet) |
| I_{i-j}^σ | Line current at any phase σ between nodes i and j (A) |
| K_1 | Parameter setting of both continuous and piecewise linear Q(U) local control functions |
| K_2 | Parameter setting of both continuous and piecewise linear Q(U) local control functions |
| P_{MPP} | MPP power from PV array (W) |

| | |
|---------------------|---|
| s_{irr} | Solar irradiance (kW/m ²) |
| T_{amb} | Ambient temperature (°C) |
| T_{cell} | Cell temperature (°C) |
| V_{cri} | Parameter setting of continuous P(U) local control function |
| V_{p1} | Parameter setting of piecewise linear P(U) local control function |
| V_{p2} | Parameter setting of piecewise linear P(U) local control function |
| V_q | Parameter setting of continuous Q(U) local control function |
| V_{q1} | Parameter setting of piecewise linear Q(U) local control function |
| V_{q1} | Parameter setting of piecewise linear Q(U) local control function |
| VUF_i | Voltage unbalance factor at node i |
| w | Step-length value |
| Y_{ij} | Admittance matrix between nodes i and j (pu.) |
| $z^{\sigma\sigma}$ | Self impedance of conductor phase σ (Ω /mile) |
| $z^{\sigma\sigma'}$ | Mutual impedance between conductor phase σ and σ' (Ω /mile) |
| θ_{ij} | Phase angle of admittance matrix between nodes i and j (radians) |
| δ_i^σ | The phase angle at node i , phase σ (radians) |
| δ_p | Parameter setting of continuous P(U) local control function |
| δ_q | Parameter setting of continuous Q(U) local control function |
| ρ | Standard deviation value of normal distribution probability |
| μ | Mean value of normal distribution probability |

CHAPTER 1

INTRODUCTION

The introduction begins with the problem statement which specifies the problem to be solved in this dissertation. After that, objective, scope, steps of study, and expected benefits are described. Finally, the dissertation structure is presented.

1.1 Problem Statement

Solar energy is a clean energy and does not cause pollution to environment. Therefore, the technology for generating electricity from solar energy has been developed such as Photovoltaic (PV). In many countries, the renewable energy, especially solar energy, is emphasized for replacing the electricity generation from fossil fuel. In Germany, their policy supporting the PV installation into the grid such as high Feed-In-Tariff (FIT) and Distribution System Operators (DSOs) are obliged to respond grid reinforcement cost to support PV installation according to §14 EEG [1]. Then, there are total PV installations around 41.3 Gigawatts peak (GWp) in Germany in 2016. In Thailand, there is Alternative Energy Development Plan (AEDP) [2] that total PV installations in 2035 should be around 11% of global electricity production. For total PV installation, the ministry of energy and the related agencies in Thailand have set the additional guidelines for covering in the household level to drive AEDP to meet the goal. The additional guideline relates PV installation at the house rooftop for supporting electricity in Low Voltage (LV) distribution system. However, more PV installations in LV distribution system can bring about such the following problems:

- Loss of real power generation because the overvoltage protection of the PV inverter is operated, whereby most PV inverters in the downstream nodes are disconnected.
- Voltage unbalance due to the connection of a single-phase PV inverter.

Generally, the aforementioned problems can be resolved by the followings [3-6]:

- Installing an MV/LV transformer with an On-Load Tap Changer (OLTC).
- Installing an energy storage system.

195938377

CD :Thesis 5671437221 dissertation / rev: 24072562 19:37:03 / seq: 6

- Changing conductor size of LV feeder.

However, installing an OLTC has the limitation that it increases significantly the cost of the MV/LV distribution transformer and is unable to change tap positions frequently when voltage variation occurs on the LV feeder due to intermittent sunlight. Energy storage systems, which have been proved as flexible tools for peak-shaving, power shifting, and electrical backup, are still very expensive. Finally, changing into larger conductor size have to invest for new line conductor.

To support more PV installation or high PV penetration in LV distribution system, many previous researches [7-13] have studied in controlling PV system instead because it is cheaper than installing OLTC, installing energy storage system, or changing into new larger conductor. In addition, PV system is an electronic device that can adjust power output frequently. The previous researches [7-13] have been studied with different three aspects as follows.

- 1. Central control regulates each PV system directly:** In the research [7], central control or Distribution System Operator (DSO) regulates only reactive power output from each PV system every 10 second in 3-phase balanced LV grid. In the researches [8, 10], central control regulates maximum allowable real power output and reactive power output from each PV system every 1 hour. The research [8] considers on 3-phase balanced LV distribution system but the research [10] considers on 3-phase unbalanced LV distribution system. The researches [7, 8] consider only 3-phase PV system and the research [10] considers only single-phase PV system.
- 2. Each PV system is controlled by self-local control:** Each PV system have self-local control to adjust real or reactive power output automatically. The research [11] considers only local control Q(U) function which reactive power output will be changed when voltage at the connection of PV system is changed. The research [12] considers only local control P(U) function which real power output will be changed when voltage at the connection of PV system is changed. Finally, the research [9] considers both P(U) and Q(U) function. All researches [9, 11, 12] consider on 3-phase balanced LV distribution system and only 3-phase PV system.

195938377

3. **The coordination between central and local control:** In this case, central control can adjust parameter setting of local control of each PV system. The research [13] considers the adjustment of local control once per day. The local control includes Q(P) function, which reactive power output will be changed when real power output is changed, and real power limitation which PV system will not generate real power output more than specified real power limitation. The research [13] considers on 3-phase unbalanced LV distribution system and only single-phase PV system.

All researches [7-13] determine the control of PV system by central or local control for controlling voltage, current and transformer capacity in LV distribution system within the limit. The researches [7-9, 11, 12] consider on 3-phase balanced LV distribution system but the actual LV distribution system is normally a 3-phase unbalanced grid. All researches [7-13] determine PV system as only 3-phase or 1-phase connection that conflict the actual situation. The actual LV distribution system will be connected by both 3-phase and 1-phase PV system. The research [7] needs very reliable communication system because central control communicate each PV system every 10 seconds. If the communication system fails, PV system cannot adjust reactive power according to the command of central control and, then system voltage may be risen and exceed the limit if the system load is decreased. Consequently, some PV system will be disconnected from LV distribution system by its overvoltage protection of each PV system. The researches [8] and [10] predict load and solar irradiance one hour ahead and find optimal maximum allowable real power output and reactive power output from each PV system. The researches [8] and [10] do not consider the uncertainty of load and solar irradiance during one hour and, then the disadvantage is that if the system load during one hour ahead such as 30 minutes ahead decreases from the predicted system load, it can cause voltage rise that may exceed the limit and some PV system will be disconnected from LV distribution system. The researches [11] and [12] consider fixed parameter setting of local control P(U) or Q(U) function from the load and solar irradiance profile which are assumed as the same in every day. The disadvantage is as load and solar irradiance profile actually are not the same in every day and, then the result of fixed parameter setting of local control is not reliable for applying in real LV distribution system. The research [9] determines the same

195938377

parameter setting of local control of each PV system which the system voltage results can be within the limit. However, the research [9] does not determine the maximum utilization of real power output from each PV system. Finally, the research [13] find the parameter setting from predicted load and solar irradiance profile one day ahead. The disadvantage is that if the actual load is less than the predicted load, it can cause voltage rise that may exceed the limit and some PV system will be disconnected from LV distribution system.

In this research, the coordination between central and local control is chosen for the applied control strategy because communication system does not need for very reliable system and the parameter setting of local control can be adjusted to suit each specific time period. Some researches [7-9, 11, 12] consider LV distribution system as a 3-phase balanced distribution system that conflict with the actual LV distribution system. Then, this research considers LV distribution system as 3-phase unbalanced distribution system. All researches [7-13] consider PV system as only 3-phase or 1-phase connection. Then, this research considers PV system as both 3-phase and 1-phase connection according to actual situation in LV distribution system. All researches [7-13] does not consider the uncertainty of load and solar irradiance. Then, this research considers the uncertainty of load and solar irradiance carefully for finding optimal parameter setting of local control. Moreover, All researches [7-13] does not consider the voltage unbalance due to the connection of 1-phase PV system. Then, the voltage unbalance is considered in this research. Local control scheme function is determined both continuous and piecewise linear functions. The power flow algorithm with using local control function will apply Newton-Raphson method with step-length adjustment. 2-stage Particle Swarm Optimization (PSO) will be applied for finding optimal parameter setting of local control in this research. The optimization problem is maximization of real power output from overall PV systems. The modified 19-node and 29-node will be demonstrated to show the effectiveness of the result of the optimal parameter setting of local control.

The main contribution of this dissertation can be concluded that the uncertainty of load and solar irradiance are considered carefully for finding optimal parameter setting of local control. The power flow results from the optimal parameter setting can

be shown in Chapter 7 and they are regulated within the limit effectively under the uncertainty of load and solar irradiance.

1.2 Objective

- Determine the coordination between central and local control strategy to support high PV penetration in LV distribution system.
- Determine the solution for assessing the optimal parameter setting of local control of PV system by considering the uncertainty of load and solar irradiance..

1.3 Scope of Research Work and Limitations

1. Only LV distribution system is considered.
2. LV distribution system is considered as only radial system.
3. 3-phase PV system is considered as generating only positive sequence current.
4. PV system of any one household has only one PV inverter.
5. PV system is assumingly lossless.
6. PV system can be embed both two types of local control function such as continuous and piecewise linear functions but only one type can be selected to operate at specific time.
7. LV distribution system is considered as 3-phases 4-wires system with multi-grounded.
8. LV distribution system is considered in normal condition and fault condition is not considered.
9. The constraints of line flow limit, transformer capacity limit, voltage limit, voltage unbalance factor limit in LV distribution system are considered.

1.4 Steps of Study

1. Studying the principles of LV distribution system.
2. Studying 3-phases power flow.
3. Studying grid connected PV system standards.

195938377

CU Theses 5671437221 dissertation / recv: 24072562 19:37:03 / seq: 6

4. Reviewing the literatures related to the voltage control in LV distribution system.
5. Reviewing the literatures related to PSO optimization technique.
6. Formulating and developing the optimization problem in order to determine the optimal parameters setting of local control.
7. Determining the relevant data in simulation.
8. Simulating the test system.
9. Concluding the research and writing the dissertation and academic papers.

1.5 Dissertation Structure

The rest of this dissertation is organized as follows. In the next chapter, the current situation of PV system in LV distribution system in many countries is presented. Chapter 3 clarifies interconnection system requirements for PV system in LV distribution system in many standards. In Chapter 4, the applied control strategy is presented in coordination between central and local control. In Chapter 5, 2-stage PSO and the power flow algorithm with using local control function will be explained in optimization process. Chapter 6 presents 2 test systems and 1 week collected data in test system details. After that, the simulations are demonstrated in 2 test systems and 1 week collected data and the results are discussed. Finally, the conclusion of this research is drawn.

195938377

CHAPTER 2

THE CURRENT SITUATION OF PV SYSTEM IN LV DISTRIBUTION SYSTEMS

PV system is a renewable energy source that has grown steadily in many countries, because solar energy is a clean energy source that is never used up and is environmentally friendly. Plus, the prices of equipment related to the PV system are on the downward trend. It is the cause for many country to expand the electrical generation by promoting rooftop PV system installation at residence or at LV distribution system. In this chapter, it will be divided into 3 topics.

2.1 Components of PV System

There are two components of PV system that are consisted of PV array and PV inverter as shown in Figure 2.1.

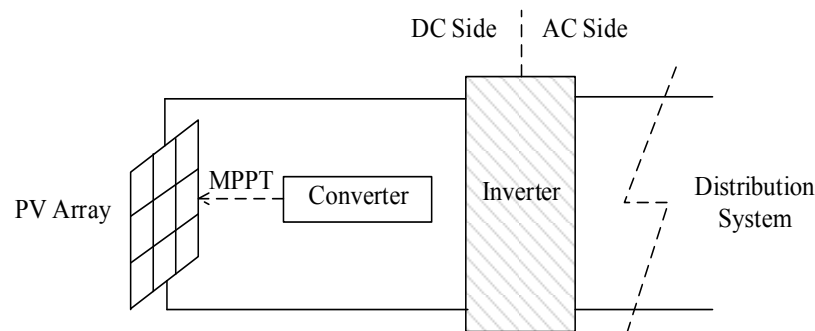

Figure 2.1 PV System

2.1.1 PV Array

Photovoltaic (PV) cell is an electronic invention made of semiconductor and it is responsible for turning light energy into electricity. The light may be from the sun or lamp. Many PV cells are combined together into PV module to produce higher voltages, current and power levels. A PV array is the complete DC current generating unit, consisting of any number of PV modules. The most popular substance that is used to produce PV cell can be divided into 2 type [14-16].

2.1.1.1 Silicon

At the present, PV cell is mostly produced from silicon substance and it can be divided into two types according to the crystal characteristic.

1. Crystalline silicon can be divided into mono and poly crystalline silicon. Silicon is one of the most abundant elements in the world from the smelting and sanding processes and, then, silicon is the cheapest semiconductor material. Silicon is commonly used as a substance for electronic industry such as transistors and Integrated Circuits (ICs). For mono crystalline silicon or c-Si, it is popular and widely used, such as in remote rural areas, or in places where access to electricity utilities is difficult, such as in the northern part of Thailand. For poly crystalline silicon or pc-Si, it is a result of the efforts to reduce the cost of c-Si solar cells. pc-Si solar cells production have lower cost than c-Si solar cells around 10% and, then, pc-Si solar cells are popular in Thailand too.
2. Amorphous silicon is the product of silicon substance too but not in the form of crystals. Amorphous silicon cause a thin layer of silicon only 300 nano metre thin. It is lightweight, easy to manufacture, has the advantage of not polluting the environment. The application of amorphous silicon are such as small calculator and watch.

2.1.1.2 Non-Silicon

Non-silicon solar cells are made of other substance that is not silicon. The highlight of this type of solar cell is the efficiency of up to 25 percent, but the price is very high. It is rarely used on the earth. Often used in space, such as satellites and concentrated solar power plant. Currently, only 7% of this type of solar cells is used.

2.1.1.3 Maximum Power Point Calculation of PV Array

PV array can produce DC current when sunlight fall onto the PV cell and PV inverter will track DC current at Maximum Power Point (MPP) which can be calculated regarding to the solar irradiance, ambient temperature, and the characteristic of module as shown in equations (2.1)-(2.5) [17].

$$T_{cell} = T_{amb} + s_{irr} \left(\frac{N_{OT} - 20}{0.8} \right) \quad (2.1)$$

$$I_{sc} = \frac{s_{irr}}{0.8} (I_{sc}^0 + K_i [T_{cell} - N_{OT}]) \quad (2.2)$$

$$V_{oc} = V_{oc}^0 + K_v [T_{cell} - N_{OT}] \quad (2.3)$$

$$FF = \frac{V_{MPP}^0 \cdot I_{MPP}^0}{V_{oc}^0 \cdot I_{sc}^0} \quad (2.4)$$

$$P_{MPP} = N_s \cdot FF \cdot V_{oc} \cdot I_{sc} \quad (2.5)$$

where T_{cell} , T_{amb} and N_{OT} are temperature ($^{\circ}\text{C}$) of cell, ambience and nominal cell operation respectively. s_{irr} is solar irradiance (kW/m^2); V_{oc}^0 is open-circuit voltage at normal cell operating temperature (V); I_{sc}^0 is short-circuit current at normal cell operating temperature (A); V_{MPP}^0 is MPP voltage at normal cell operating temperature (V); I_{MPP}^0 is MPP current at normal cell operating temperature (A); K_v and K_i are voltage and current temperature coefficient ($\text{V}/^{\circ}\text{C}$ and $\text{A}/^{\circ}\text{C}$) respectively; N_s is number of PV module; P_{MPP} is MPP power from PV array (W).

2.1.2 PV Inverter

PV inverter is a device that converts DC current into AC current to connect to electrical system properly and PV inverter must meet the requirement from grid code [18, 19] such as PV inverter must not generate harmonic current exceeding the limit and must be able to adjust Power Factor (PF). Most of PV inverter will initiate to generate real power output when solar irradiance is more than $0.05 \text{ kW}/\text{m}^2$ [20].

In this research, a single-phase PV system is defined as a PV system that consists of only one single-phase inverter which apparent power output at any connected phase can be calculated from P(U) and Q(U) local control functions. A three-phase PV system is defined as a PV system that consists of only one three-phase inverter. For a three-phase PV inverter, it is considered as positive-sequence current generation source [21]. Then, positive-sequence current ($I_i^{po} = I_i^{po,r} + j \cdot I_i^{po,m}$) can be calculated, when total generation $P_{i,pv}$ and $Q_{i,pv}$ are known from P(U) and Q(U) local control functions, in equation (2.6). The derivation of equation (2.6) is shown in Appendix A. After I_i^{po} is obtained, each phase current injection can be calculated from equation (2.7) where zero and negative sequence currents (I_i^{ze} and I_i^{ne}) are defined as

zero because this inverter generates only positive-sequence current. Finally, apparent power output of each phase can be calculated from equation (2.8) where δ is phase angle. The P(U) and Q(U) local control functions will be addressed later in Chapter 4.

$$\begin{bmatrix} I_i^{po,r} \\ I_i^{po,m} \end{bmatrix} = \frac{1}{3} \times \begin{bmatrix} V_i^{po,r} & V_i^{po,m} \\ V_i^{po,m} & -V_i^{po,r} \end{bmatrix}^{-1} \times \begin{bmatrix} P_{i,pv} \\ Q_{i,pv} \end{bmatrix} \quad (2.6)$$

$$\begin{bmatrix} I_i^A \\ I_i^B \\ I_i^C \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & a^2 & a \\ 1 & a & a^2 \end{bmatrix} \times \begin{bmatrix} I_i^{ze} \\ I_i^{po} \\ I_i^{ne} \end{bmatrix} = \begin{bmatrix} I_i^{po} \\ a^2 \cdot I_i^{po} \\ a \cdot I_i^{po} \end{bmatrix} ; a = 1 \angle 120^\circ \quad (2.7)$$

$$\begin{bmatrix} P_{i,pv}^A + j \cdot Q_{i,pv}^A \\ P_{i,pv}^B + j \cdot Q_{i,pv}^B \\ P_{i,pv}^C + j \cdot Q_{i,pv}^C \end{bmatrix} = \begin{bmatrix} V_i^A \angle \delta_i^A & 0 & 0 \\ 0 & V_i^B \angle \delta_i^B & 0 \\ 0 & 0 & V_i^C \angle \delta_i^C \end{bmatrix} \times \begin{bmatrix} I_i^A \\ I_i^B \\ I_i^C \end{bmatrix}^* \quad (2.8)$$

$$= \begin{bmatrix} V_i^A \angle \delta_i^A \cdot (I_i^{po,r} - j \cdot I_i^{po,m}) \\ V_i^B \angle (\delta_i^B + 120^\circ) \cdot (I_i^{po,r} - j \cdot I_i^{po,m}) \\ V_i^C \angle (\delta_i^C - 120^\circ) \cdot (I_i^{po,r} - j \cdot I_i^{po,m}) \end{bmatrix}$$

For example, there is three-phase PV inverter connected with node i that phase A, B and C voltages are $220 \angle 0^\circ$, $225 \angle -127^\circ$ and $221 \angle 121^\circ$ V respectively. Total power output $P_{i,pv} + jQ_{i,pv}$ is $5,000 - j2,000$ VA. Then, power output of each phase can be calculated in 4 steps as follows.

STEP 1: Find positive sequence voltage from equation (2.9).

$$\begin{bmatrix} V_i^{ze} \\ V_i^{po} \\ V_i^{ne} \end{bmatrix} = \begin{bmatrix} 1 & 1 & 1 \\ 1 & a^2 & a \\ 1 & a & a^2 \end{bmatrix}^{-1} \times \begin{bmatrix} V_i^A \\ V_i^B \\ V_i^C \end{bmatrix} \quad (2.9)$$

Then,

$$V_i^{po,r} + jV_i^{po,m} = 221.4297 - j7.85454 \text{ V} \quad (2.10)$$

STEP 2: Find positive sequence current from equation (2.6).

$$I_i^{po,r} + jI_i^{po,m} = 7.62 + j2.74 \text{ A} \quad (2.11)$$

STEP 3: Find current of each phase from equation (2.7).

$$\begin{bmatrix} I_i^A \\ I_i^B \\ I_i^C \end{bmatrix} = \begin{bmatrix} 7.62 + j2.74 \\ -1.44 - j7.97 \\ -6.19 + j5.23 \end{bmatrix} \text{ A} \quad (2.12)$$

STEP 4: Find power output of each phase from equation (2.8).

$$\begin{bmatrix} S_i^A \\ S_i^B \\ S_i^C \end{bmatrix} = \begin{bmatrix} 1,677.29 - j602.87 \\ 1,627.48 - j821.03 \\ 1,695.23 - j576.11 \end{bmatrix} \text{ VA} \quad (2.13)$$

2.2 The Current Situation of PV System in Thailand

Thailand is near the equator and can absorb sunlight throughout the year. Most areas get solar irradiance around 5 kWh/m². Therefore, Thailand is a high potential country for installing PV system. Thai government support under the AEDP plan [2] requires the use of renewable energy to replace fossil fuels by at least 30% or 6,000 MW within 10 years.

Currently, the purchase of electricity from PV system is fixed Feed-In-Tariff (FIT). FIT is the policy tool, designed to accelerate investment in installation of PV system by offering long-term contracts. FIT comes from the calculation of plant construction costs, operating and maintenance costs over a 25 year life span. In addition, a special FIT purchase rate has been set in addition to the normal FIT purchase rate for projects in the southern border provinces of Thailand that include Yala, Pattani, Narathiwat and 4 districts in Songkhla such as Jana, Tapa, Sabayoi and Natawee to strengthen the electrical stability in the area. FIT in Thailand can be shown in Table 2.1.

Table 2.1 FIT rate for PV system in Thailand

| Type | Installed Capacity | FIT rate (Bath/kWh) | Supported period (year) | Special FIT (Bath/kWh) |
|---|----------------------------|---------------------|-------------------------|------------------------|
| House | Less than 10 kWp | 6.85 | 25 | +0.5 |
| Small Business Buildings | More than 10 to 250 kWp | 6.40 | 25 | +0.5 |
| Medium or large-sized business building / factory | More than 250 to 1,000 kWp | 6.01 | 25 | +0.5 |

| Type | Installed Capacity | FIT rate (Bath/kWh) | Supported period (year) | Special FIT (Bath/kWh) |
|--|----------------------|---------------------|-------------------------|------------------------|
| Government agencies and agricultural cooperatives. | More than 1 to 5 MWp | 5.66 | 25 | - |

From data in 2015 as shown in Figure 2.2 [22], the installed solar PV system volume was lower than the AEDP 2012-2021 target (the target is 3,800 MW). Then, Thai government should increase incentives to increase the installation of PV system as planned or as close to the plan as possible.

Figure 2.2 The bar chart between the installed PV capacity and the AEDP 2012-2021 target[22]

2.3 The Current Situation of PV System in Other Countries

PV system is a widely used electricity generation system in foreign countries. In this section, the countries with the highest proportion of installed PV capacity are presented such as Germany, Japan and USA.

2.3.1 Germany

Germany or the Federal Republic of Germany located at latitude $51^{\circ} 30' 0''$ and longitude $10^{\circ} 30' 0''$. Figure 2.3 compares the intensity of sunlight in Germany compared to Thailand. Thailand has an average solar intensity of $1,800 \text{ kWh/m}^2$, which is higher than Germany with an average solar intensity of 950 kWh/m^2 . It is found that Germany has a lower average solar intensity per square meter than Thailand but Germany is currently the top proportion of PV system in the world. Electricity generated from renewable energy as shown in Figure 2.4, it is showed that Germany can generate 217,857 GWh from renewable energy source in 2017. Considering only solar power, Germany can generate 39,895 GWh from solar power generation in 2017 and electricity generated from solar power generation is on the rise every year.

Figure 2.3 The intensity of solar radiation in Germany and Thailand [23]

Figure 2.4 Electricity generated from renewable energy [24]

The cost of electricity produced by PV system is comparable to other fuels as shown Figure 2.5 that the tariff of consumed electricity in Germany was cheap at the beginning but the prices are rising every year (shown in Line 5). The FIT of PV system was previously very expensive and is likely to decline rapidly (shown in Line 1). The tariff of consumed electricity and the FIT of PV system are the same in 2012 (as shown in the chart) and the FIT of PV system is a tendency to decrease continuously in the future.

The rate of electricity purchased from Germany's solar PV systems is Fix Feed-in-Tariff as shown in Table 2.2.

Figure 2.5 Price of electricity from various power generation systems [25]

Table 2.2 FIT rate for PV system in Germany [26]

| Installed PV Capacity | FIT rate (ct/kWh) |
|-----------------------|-------------------|
| < 10 kWp | 19.5 |
| < 40 kWp | 18.5 |
| < 1,000 kWp | 16.5 |
| < 10 MWp | 13.5 |

2.3.2 Japan

Japan is another successful country in installing PV system. In Japan, the installed PV capacity of 2010 was 990 MW, 95% of which was installed on the roof of the house. But after the earthquake and the explosion of the Fukushima nuclear power plant in 2011, Japan has turned its attention to more renewable electricity generation. In 2011, total PV capacity was installed at 1,296 MW which PV system on the roof are 80%. In 2012, total PV capacity has been installed 1,718 MW, up 33% from the previous year.

Japan aims to install PV systems by 2030 as shown the target plan in Figure 2.6, expectedly with a 36.4 GW share of installed PV systems at residence, a 34.6 GW share of installed PV systems for a plant of PV system is less than 1 MW and a 29.1 GW share of installed PV systems for a plant of PV system is more than 1 MW. The total installed PV systems will be 100 GW in 2030 or 11% of the electricity demand in Japan.

Figure 2.6 The target of installed PV capacities [27]

For the electricity price trend per kWh produced from PV systems, Figure 2.7 shows that in 2010, the cost of electricity generated from solar PV systems was 40 JPY/kWh. It is twice as expensive as consumed electricity price, but the price per kWh of electricity produced by solar PV systems is on the downward trend. In 2014, the price of electricity generated by PV systems is expected to decrease to 26 JPY/kWh which is lower than the consumed electricity price of the same year at 26.3 JPY/kWh.

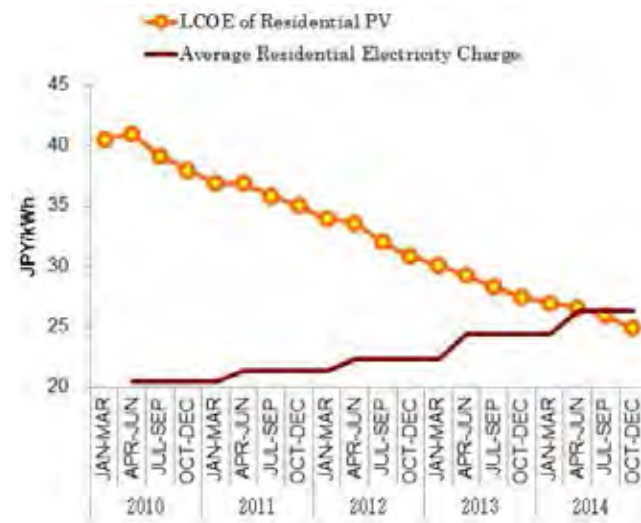

Figure 2.7 Electricity price per kWh from residential PV generation system [28]

2.3.3 USA

The United States is another country with more installed PV systems. Even though the electricity generated by PV systems is only 0.4% of the country's capacity, it has grown significantly. Figure 2.8 shows the size of the installation of a PV system. The overall size of the installation is likely to increase every year, especially on residence side.

Figure 2.8 The installed PV capacity [29]

The price of solar panels per panel and the cost of installing PV system in the United States is shown in Figure 2.9. Looking back in 2008, the cost of installing PV system are \$ 8 per watt, while the cost is decreased into the half in 2017. The cost of PV system installation is on the downward trend during the year 2008-2012 that the price of solar panels dropped by 86% and the total PV system installation cost dropped by 39%. In 2013-2017, the price of solar panels decrease by 6% while the price of whole installation decreased by 33%.

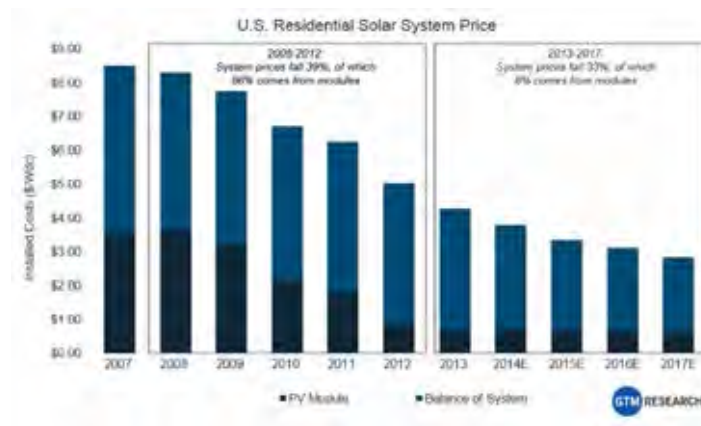

Figure 2.9 Cost of installing solar PV system in the United States [30]

CHAPTER 3

INTERTCONNECTION SYSTEM REQUIREMENTS FOR PV SYSTEM IN LV DISTRIBUTION SYSTEM

To respond the increase in household PV system or PV system connected to LV distribution system, it should have a standard to support connected PV system to prevent problems in LV distribution system. In this research, there are 4 standards to be considered as follows.

3.1 VDE-AR-N 4105:2011-08, Power Generation Systems Connected to the Low-Voltage Distribution Network – Technical Minimum Requirements for the Connection to and Parallel Operation with Low-Voltage Distribution Networks (2011) [31]

This standard is used in Germany. It applies to the planning, construction, operation and modification of PV systems that are connected to a network operator's LV system and operated in parallel with LV system. The details of this standard can be clarified into:

3.1.1 Capacity of PV System

If several single phase PV inverters are connected to the same connection point, then uniform distribution of the power supplied to the three line conductors shall be aimed for, where a maximum power difference of 4.6 kVA shall not be exceeded. For the maximum allowable capacity of PV systems in LV system, it will be determined by system operator.

3.1.2 Power quality at the connection point of PV system

Connecting a PV inverter to LV system, it requires the following feature:

3.1.2.1 Voltage and PF Control

PV inverter must disconnect from LV system when voltage is out of limit as follows where V_N is normal operating voltage.

Table 3.1 The duration of PV inverter for disconnecting from LV system

| Protective Function | | Protection Relay Setting Values | |
|----------------------------|---------|---------------------------------|------------|
| Voltage drop protection | $V <$ | $0.8 \cdot V_N$ | < 100 ms |
| Rise-in-voltage protection | $V >$ | $1.1 \cdot V_N$ | < 100 ms |
| Rise-in-voltage protection | $V \gg$ | $1.15 \cdot V_N$ | < 100 ms |

Irrespective of the number of feed-in phase, PV inverter shall allow for operation under normal stationary operating conditions in the voltage tolerance band $V_N \pm 10\%$ and in their permissible operation points starting with an active power output of more than 20% of the rated active power with the following displacement factors $\cos \varphi$ or PF. Figure 3.1 shows the standard characteristic curve for $\cos \varphi(P)$ or PF(P) where P_{out} is real power output from PV inverter and P_{rates} is rated real power of PV inverter.

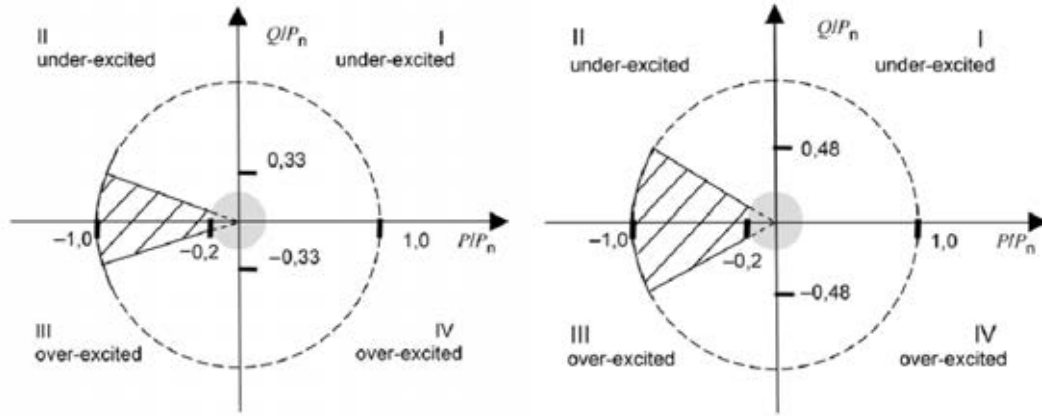

Figure 3.1 Standard characteristic curve for $\cos \varphi(P)$ or PF(P) [31]

- PV inverter size ≤ 3.68 kVA:
 $PF = 0.95_{\text{under-excited}}$ to $0.95_{\text{over-excited}}$ which can be adjusted in fixed PF.
- PV inverter size ≤ 13.8 kVA but > 3.68 kVA:
 Characteristic curve provided by network operator within $PF = 0.95_{\text{under-excited}}$ to $0.95_{\text{over-excited}}$ (see Figure 3.2).

- PV inverter size > 13.8 kVA:

Characteristic curve provided by network operator within PF = 0.90_{under-excited} to 0.90_{over-excited} (see Figure 3.2).

(a) PV inverter size ≤ 13.8 kVA but > 3.68 kVA

(b) PV inverter size > 13.8 kVA

Figure 3.2 Limit power range for the reactive power of PV inverter [31]

3.1.2.2 Frequency Control

PV inverter must disconnect from LV system when voltage is out of limit between 47.5 to 51.5 Hz as follows.

Table 3.2 The duration of PV inverter for disconnecting from LV system

| Protective Function | | Protection Relay Setting Values | |
|-------------------------------|-------|---------------------------------|----------|
| Frequency decrease protection | $f <$ | 47.5 Hz | < 100 ms |
| Frequency increase protection | $f >$ | 51.5 Hz | < 100 ms |

At frequencies between 50.2 Hz and 51.5 Hz, all adjustable PV inverter shall reduce (for frequency increase) or increase (for frequency decrease) the active power P_M generated instantaneously (at the time of exceeding the mains frequency 50.2 Hz; freezing the value on the current level) with a gradient of 40% of P_M per Hertz (see Figure 3.3, where P_M is the power generated at the time of exceeding 50.2 Hz; P is the power reduction; f_{mains} is the mains frequency). From this, it follows that PV inverter will continuously move up and down the frequency characteristic curve in the

frequency range of 50.2 Hz to 51.5 Hz with regard to its active power feed-in (“running along the characteristic curve”).

Figure 3.3 Active power reduction at over-frequency [31]

3.1.2.3 Flicker Control

Flicker describes a phenomenon which is characterized by voltage fluctuations whose frequency and amplitude are of a magnitude that causes lamps supplied with this voltage to show disturbing brightness fluctuations. PV inverter shall not exceed long-term severity values (P_{lt}) at 0.5.

3.1.2.4 Harmonic Control

According VDE-AR-N:4015-2011 [31], permissible harmonic currents related to the network short-circuit power S_{kv} that may be supplied in a network connection point can be shown in Table 3.3.

3.1.2.5 DC Current Control

In this standard, the limit of DC current generation from PV inverter does not specify.

3.1.3 The Need for Communication System

In Germany, audio-frequency centralized ripple-control, which are usually operated at frequencies between approximately 100 Hz and 1,500 Hz, use to broadcast control action, such as limiting real power output, to connected PV inverter. Broadcasting levels of audio-frequency impulses are normally about 1% V_N to 4% V_N .

3.2 Standard for Interconnecting Distributed Resources with Electric Power Systems, PEA Grid Code, Thailand (2016) [19]

This standard is used in 74 provinces of Thailand, except Bangkok, Nonthaburi and Samutprakarn. The details of this standard can be clarified into:

3.2.1 Capacity of PV System

In LV distribution system with voltage level 380/220 V, PV system can connect to LV system with single phase connection if the capacity of single phase PV inverter is not more than 5 kW. In case of more than one single phase PV inverter need to connect to LV system, the owner must distribute into each phase connection and the summation of single phase PV inverter at any phases must not be more than 5 kW. Moreover, total connection of PV inverter behind distribution MV/LV transformer must not be more than 15% of the capacity of that MV/LV transformer.

3.2.2 Power quality at the connection point of PV system

The owner must control the PV inverter to comply the followings:

3.2.2.1 Voltage and PF Control

PV inverter must disconnect from LV system if voltage, line to neutral, exceed the limit according to Table 3.4. For PF control, PV inverter must be able to adjust Power Factor (PF) 0.95 lagging to 0.95 leading with only fixed PF method.

Table 3.4 The duration of PV inverter for disconnecting from LV system

| Voltage Level | Duration (sec) |
|--------------------------------|----------------|
| $V_{i,l-n} < 50\%$ | 0.3 |
| $50\% \leq V_{i,l-n} < 90\%$ | 2.0 |
| $90\% \leq V_{i,l-n} < 110\%$ | Still Connect |
| $110\% \leq V_{i,l-n} < 120\%$ | 1.0 |
| $V_{i,l-n} \geq 120\%$ | 0.16 |

3.2.2.2 Frequency Control

PV inverter must synchronize with LV system all time. If frequency is out of limit 47 to 52 Hz, PV inverter must disconnect from LV system within 0.1 sec.

3.2.2.3 Flicker Control

PV inverter must have short-term and long-term severity values (P_{st} and P_{lt}) within the limit: $P_{st} \leq 1.0$ and $P_{lt} \leq 0.8$.

3.2.2.4 Harmonic Control

For harmonic voltage, total harmonic distortion must be less than 5%, Moreover, odd and even harmonic voltages must be less than 4% and 2% respectively. For harmonic current, the limit can be shown in Table 3.5.

3.2.2.5 DC Current Control

PV inverter must not generate DC current more than 0.5% of rated current of PV inverter into LV system.

3.2.3 The Need for Communication System

PV system connected with LV system does not need the communication system connected with Supervisory Control And Data Acquisition (SCADA) of PEA.

Table 3.5 Harmonic order and current limit

| Harmonic Order | Current Limit (A rms) | Harmonic Order | Current Limit (A rms) |
|-----------------------|------------------------------|-----------------------|------------------------------|
| 2 | 48 | 11 | 19 |
| 3 | 34 | 12 | 6 |
| 4 | 22 | 13 | 16 |
| 5 | 56 | 14 | 5 |

| 9 | 8 | 18 | 4 |
| 10 | 7 | 19 | 6 |

3.3 Standard for Interconnecting Distributed Resources with Electric Power Systems, MEA Grid Code, Thailand (2016) [18]

This standard is used in 3 provinces of Thailand, include Bangkok, Nonthaburi and Samutprakarn. The details of this standard can be will clarified into:

3.3.1 Capacity of PV System

In LV distribution system with voltage level 380/220 V, PV system can connect to LV system with single phase connection if the capacity of single phase PV inverter is not more than 5 kW. In case of more than one single phase PV inverter need to connect to LV system, the owner must distribute into each phase connection and the summation of single phase PV inverter at any phases must not be more than 5 kW. Moreover, total connection of PV inverter behind distribution MV/LV transformer must not be more than 15% of the capacity of that MV/LV transformer.

3.3.2 Power quality at the connection point of PV system

The owner must control the PV inverter to comply the following:

3.3.2.1 Voltage and PF Control

PV inverter must disconnect from LV system if voltage exceeds the limit according to Table 3.3. For PF control, PV inverter must be able to adjust Power Factor (PF) 0.95 lagging to 0.95 leading with only fixed PF method.

Table 3.6 The duration of PV inverter for disconnecting from LV system

| Voltage Level (Volt) | | Duration (sec) |
|----------------------------|----------------------------|----------------|
| Line to Line | Line to Neutral | |
| $V_{i,l-l} < 199$ | $V_{i,l-n} < 115$ | 0.1 |
| $199 \leq V_{i,l-l} < 346$ | $115 \leq V_{i,l-n} < 200$ | 2.0 |
| $346 \leq V_{i,l-l} < 416$ | $200 \leq V_{i,l-n} < 240$ | Still Connect |
| $416 \leq V_{i,l-l} < 539$ | $240 \leq V_{i,l-n} < 311$ | 2.0 |
| $V_{i,l-l} \geq 539$ | $V_{i,l-n} \geq 311$ | 0.05 |

3.3.2.2 Frequency Control

PV inverter must synchronize with LV system all time. If frequency is out of limit 47 to 52 Hz, PV inverter must disconnect from LV system within 0.1 sec.

3.3.2.3 Flicker Control

PV inverter must comply as follows: IEC 61000-3-3 if rated current of PV inverter is less than 16 A; IEC 61000-3-5 if rated current of PV inverter is more than 75 A; IEC 61000-3-11 if rated current of PV inverter is less than 75 A.

3.3.2.4 Harmonic Control

MEA defines only harmonic current limit as shown in Table 3.7.

3.3.2.5 DC Current Control

PV inverter must not generate DC current more than 0.5% of rated current of PV inverter into LV system.

3.3.3 The Need for Communication System

PV system connected with LV system does not need the communication system connected with SCADA of MEA.

Table 3.7 Harmonic order and current limit

| Odd-Harmonic Order | Current Limit (%) | Even-Harmonic Order | Current Limit (%) |
|---------------------------|--------------------------|----------------------------|--------------------------|
| 3-9 | 4.0 | 2-10 | 1.0 |
| 11-15 | 2.0 | 12-16 | 0.5 |
| 17-21 | 1.5 | 18-22 | 0.375 |
| 23-33 | 0.6 | 24-34 | 0.15 |
| ≥ 35 | 0.3 | ≥ 36 | 0.075 |
| Total Harmonic Distortion | | | 5 |

3.4 IEC/TR 61850-90-7: Communication networks and systems for power utility automation – Part 90-7: Object models for power converters in distributed energy resources (DER) systems (2013)

PV systems tend to increase the connection in LV distribution system because of the policies of many countries and the reduction cost of related devices in PV system. The increment of PV installation in LV distribution system will cause high PV penetration problem in LV distribution system. National Research Energy Laboratory (NREL) recommends in supporting high PV penetration in LV distribution system that PV inverter should develop into advanced or smart one whose include non-autonomous and autonomous functions in PV inverter and the details can be shown in Table 3.8.

The above 3 standards (VDE-AR-N:4105-2011, PEA and MEA grid code) do not recommend smart PV inverter to support high PV penetration in LV distribution system. PEA and MEA grid code specify high PV penetration level at 15% of the size of MV/LV distribution transformer. For VDE-AR-N:4105-2011, the high PV penetration level depends on the assessment from grid operator. However, this IEC/TR 61850-90-7 standard [32] talks about the control function in smart PV inverter that the

main functions can be described such as immediate control, volt-var management, watt-triggered behavior and voltage-watt management function.

Table 3.8 Autonomous versus non-autonomous inverter functions [33]

| Description | | Functions | Associated Proceedings and Standards | |
|-----------------------------|---|---|--------------------------------------|-----------------|
| Autonomous | <ul style="list-style-type: none"> – No communications architecture needed – Behavior controlled by inverter operating parameters – Parameters defined at system commissioning or later – Parameters can be adjusted, behavior activated or deactivated at later date via remote or on-site changes | Low- / High-voltage ride-through | SIWG Phase 1 | IEEE 1547a-2014 |
| | | Low- / High-frequency ride-through | | |
| | | Volt-var control (via dynamic reactive power injection) | | |
| | | Anti-islanding | | |
| | | Ramp-rate controls (for default/emergency conditions) | | |

3.4.1 Immediate Control Functions

Immediate control functions assume a tightly coupled interaction between PV systems and a controlling entity (utility, energy service provider or grid operator). This implies that the controlling entity has knowledge about the capabilities of the PV systems, can request updates on their current status, can expect the PV systems to

follow the command to the best of their capabilities, and will receive a direct response from the PV systems on the results from following the command.

3.4.1.1 Connect/Disconnect from Grid Function

This function causes the PV system to immediately physically connect or disconnect from LV system at the connection point to LV system.

3.4.1.2 Adjust Maximum Generation Level up/down Function

This function sets the maximum generation level at the connection point to LV system as percentage. This limitation could be met by limiting PV output.

3.4.1.3 Adjust Power Factor Function

Fixed power factor will be managed through issuing a power factor value and corresponding excitation.

3.4.2 Volt-Var Management Functions

Since utilities (and/or grid operator) will be requesting var support from many different PV systems with different capabilities, different ranges, and different local condition, it would be very demanding of the communications systems, unnecessary, and ultimately impossible for the utilities to issue explicit settings to each PV system every time a change is desired. Therefore, volt-var behaviors can be configured in to a PV inverter using arrays that establish a volt-var relationship or curve for use during normal operating system.

3.4.2.1 Available Var Support Mode With No Impact On Watts Function

As one example of volt-var modes, the available vars mode reflects the calculation of the most efficient and reliable var levels for PV systems at specific connection point to LV system without impacting the watts output. This mode could also help compensate for local high voltage due to real power output back flow in LV system. In this mode, PV systems will be provided with a double array of setpoints: a set of voltage levels and their corresponding var levels as % of available vars (*VArAval*). The voltage levels will range between $V1$ and $V4$ in increasing voltage values. Values between these setpoints will be interpolated to create a piecewise linear volt-var function. Figure 3.4 provides one example of volt-var settings for this mode.

For $VArAval$, it can be calculated in equation (3.1) where S_{Spec} is the apparent power limit of PV inverter and P_{out} is real power output from PV inverter.

$$VArAval = \sqrt{S_{Spec}^2 - P_{out}^2} \tag{3.1}$$

Figure 3.4 Available var support mode with no impact on watts function [32]

3.4.2.2 Static Mode Based on Setting or Fixed PF

Another example mode establishes fixed var settings for PV inverter as illustrated in Figure 3.5. This mode does not use curves but only settings.

Figure 3.5 Static var support mode based on maximum reactive power (VArMax)

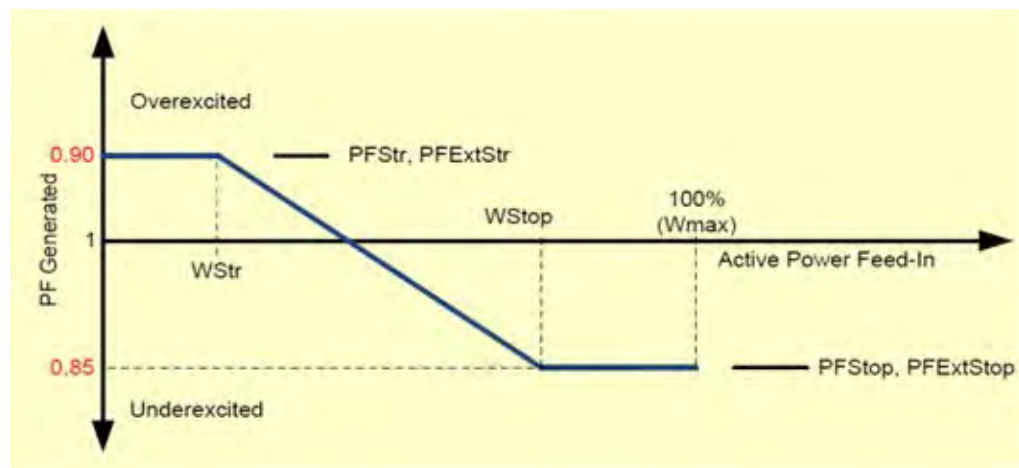

[32]

3.4.2.3 Passive Mode With No Var Support

This example mode is the same as the mode in Subsection 3.4.2.2, except that the var levels are zero.

3.4.3 Watt-Triggered Behavior Functions

The amount of watts provided at the connection point to LV system can be set to gradually modify the power factor. This watt-power factor mode is shown in Figure 3.6. The power factor will be set in relation to the feed-in power, in this example ranging from 0.85 underexcited to 0.90 overexcited. These settings are not expected to be updated very often over the life time of the PV system.

Example Settings

| Power (% WMax) | | Power Factor | | Power Factor with convention defined by PFsign and PFEExt | |
|----------------|----|--------------|------|---|--------------------|
| WStr | 20 | PFStr | 0.9 | PFEExtStr | Overexcited+ False |
| WStop | 40 | PFStop | 0.85 | PFEExtStop | Underexcited+ True |

Figure 3.6 Power factor controlled by feed-in power [32]

3.4.4 Voltage-Watt Management Functions

A voltage-watt management can be used for smoothing voltage deviation. From Figure 3.7, PV real power output will be constant if voltage increase from V1 to V2 but PV real power output will be decreasing if voltage is increasing from V2 to V3. It is because of prevention from overvoltage at V3 due to real power generation from PV inverter.

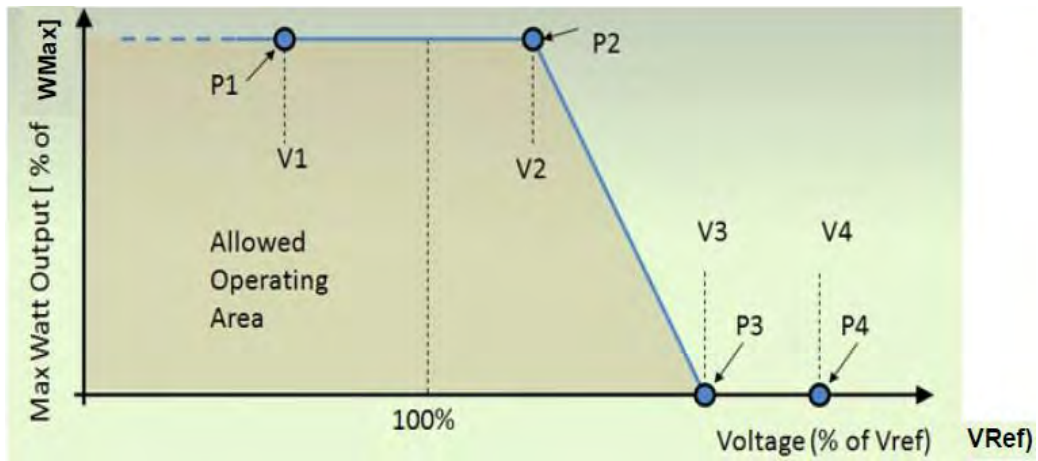

Figure 3.7 Configuration curve for maximum watts vs. voltage [32]

CHAPTER 4

COORDINATION BETWEEN CENTRAL AND LOCAL CONTROL

This chapter will address the problem in high PV penetration in LV system, which is aimed to be solved by applying only central or local control and coordination between central and local control.

4.1 Impact of the Installation of PV system in LV System

The connection of PV systems is currently increasing in LV distribution system, especially at households, due to the support of government and the decrease of solar PV system installation cost. However, more installation of solar PV systems in LV distribution system can cause the disadvantages as follows.

4.1.1 Voltage Unbalance

In the situation where there is too many solar PV systems installed in LV distribution system, especially single-phase PV inverter and the installation in each phase is not the same size. Consequently, the voltage in each phase is not equal which is the problem with unbalanced voltage in the LV system. For example, Figure 4.1 shows a connected single-phase PV inverter with only 2 phases (A and B) and also different size, so it will cause a voltage unbalance. From the IEC 61000-2-2 [33], it specifies voltage unbalance factor in LV distribution system that should not exceed 3% of The voltage unbalance factor can be calculated from equation (2.6) where VUF_i is voltage unbalance factor at node i ; $V_{i,ne}$ is negative-sequence voltage at node i (V); $V_{i,po}$ is positive-sequence voltage at node i (V).

$$VUF_i = \frac{|V_{i,ne}|}{|V_{i,po}|} \times 100\% \quad (4.1)$$

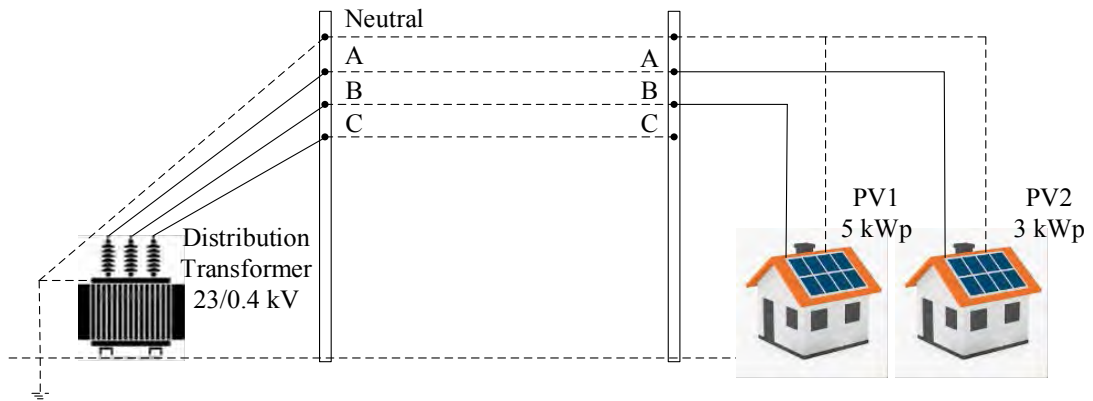

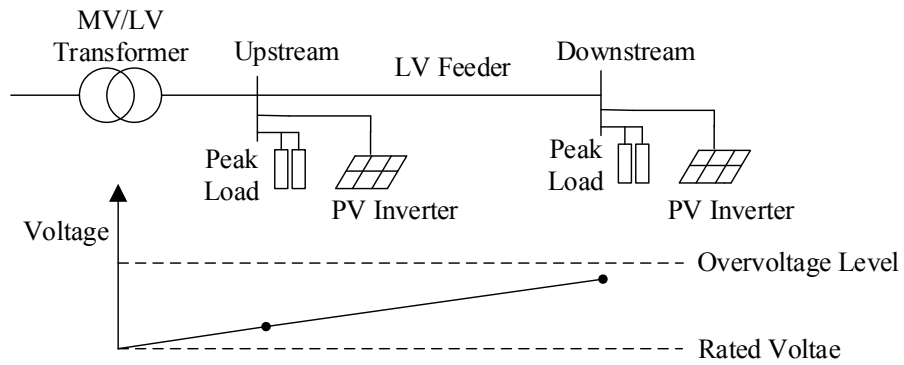

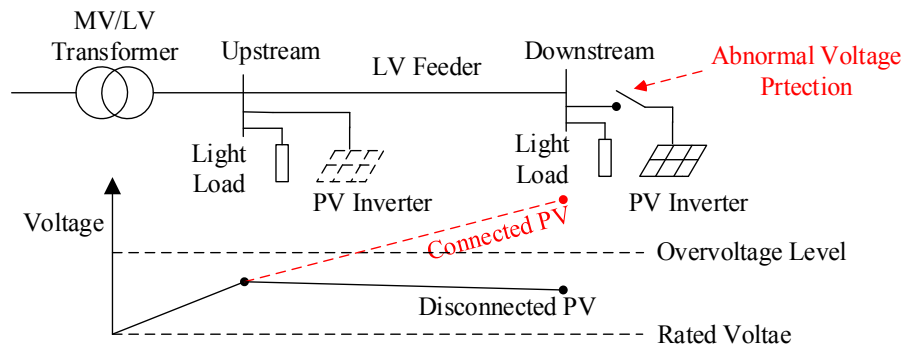

Figure 4.1 The example of installed single-phase PV inverter which causes voltage unbalance

4.1.2 Loss of PV generation

In the situation where there is solar PV system installed in LV system, especially on downstream nodes, voltage can be risen at the end of system as shown in Figure 4.2 (a). However, voltage can be ramped up over the overvoltage limit when system load is decreased as shown in Figure 4.2 (b) and, then the overvoltage protection of the PV inverter will operate, whereby the PV inverters in the downstream nodes are disconnected. Consequently, loss of PV generation is occurred.

(a) At peak load

(b) At light load

Figure 4.2 Voltage profile example in LV distribution system

4.2 Central Control

The concept of central control is that there is a central computer unit which controls each connected PV system following the command of central unit such as adjusting power factor, real power output and reactive power. The diagram for the concept of central control can be shown in Figure 4.3. The advantage is fast response in voltage control in LV system through communication system. The disadvantage is the need of very reliable communication system because some PV system will be disconnected from LV system in some situations if the command in communication medium is lost or that PV system is uncontrolled as shown in Figure 4.4 which is modified from Figure 4.2 in light load situation.

Figure 4.3 The diagram of central control and connected PV system [7]

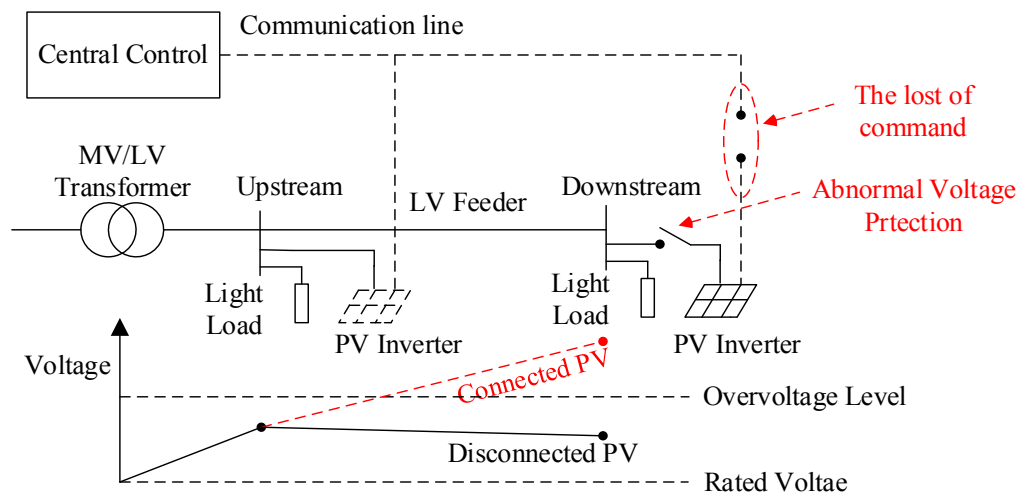

Figure 4.4 The communication lost which can cause the disconnected PV system

4.3 Local Control

Local control or autonomous control can operate at PV inverter autonomously. For example, they can be shown in previous Subsections 3.4.2 to 3.4.4. In Figure 3.4, volt-var function, when voltage at the connection point of PV system is changed, reactive power output from PV system is also changed. In Figure 3.6, watt triggered behavior function, when real power output from PV system is changed, reactive power from PV system is also changed. Finally Figure 3.7, voltage-watt management function, uses for smoothing voltage deviation. When voltage at the connection point of PV system is changed, real power output from PV system is also changed. The advantage of local control is that there is no need for communication system with other units because PV system just uses local condition for adjusting following local control function. The disadvantage is the parameter setting of local control is fixed for all times that it is not optimal for any specified period, such as one-week period because load profile from each one-week period is likely to be different. Then, optimal parameter setting should be readjusted every one week.

4.4 Coordination between Central and Local Control

This research applies coordination setting between central and local control to support high PV penetration in LV distribution system. It is because of benefits as followings:

- The coordination setting between central and local control does not need for very reliable communication system because central control rarely contacts with each PV system to update parameter setting of local control.
- When the communication signals to the PV systems are loss. Those PV systems can still operate following the past parameter setting of local control.

The big picture of the coordination between central and local control can be shown in Figure 4.5 which LV distribution system must be based on smart grid. LV distribution system must integrate with smart meter or even ambient weather sensor to monitor or predict the condition that affects LV distribution system. PV system must be smart and can be embedded local control for controlling real and reactive power output. Moreover, PV system must be capable to receive or send signal to remote unit or central control.

Figure 4.5 The coordination between central and local control

4.4.1 Local Control Application

In this dissertation, PV system is determined that it can be embed by both two types of local control function such as continuous and piecewise linear functions and, however, only one type can be selected to operate at specific time. The details of both two types of local control function can be explained as follows.

4.4.1.1 Continuous Local Control Function

Research [12] uses local control that can be shown in equation (4.2) where Q_i is reactive power output from PV inverter at connection point i (Var); Q_i^{max} is maximum reactive power capability of PV system at connection point i (VAr); δ_i is slope of $Q_i(Q_i^{max}, \delta_i, V_i)$ function at connection point i ; V_i is voltage at the connection point i of PV system (pu).

$$Q_i(Q_i^{max}, \delta_i, V_i) = Q_i^{max} \left(1 - \frac{2}{1 + \exp[-4(V_i - 1)/\delta_i]} \right) \quad (4.2)$$

Voltage-watt function or P(U) function in equations (4.3) and (4.4) that are used in this research. They can be modified from equation (4.2). Q_i^{max} in equation (4.2) is replaced by P_i^{max} or maximum real power output that depend on specified rated real power output ($P_{i,rated}$) and MPP from PV array ($P_{i,MPP}$) and P_i^{max} determination can be shown in equation (4.5). For $P_{i,MPP}$, it can be calculated from Equations (2.1)-(2.5). The constant 1 which is in term of \exp in equation (4.2) is replaced by $V_{i,cri}^\sigma$ or $V_{i,cri}$. The variable δ_i in equation (4.2) is replaced by $\delta_{i,p}^\sigma$ or $\delta_{i,p}$. The variable V_i in equation (4.2) is replaced by $|V_i^\sigma|$ or $(|V_i^A| + |V_i^B| + |V_i^C|)/3$. The equations (4.3) and (4.4) are for single and three phase PV inverter respectively. The adjustment of $V_{i,cri}$ (or $V_{i,cri}^\sigma$) will cause the change of the voltage which initiates limiting real power as shown in Figure 4.6 (a). The adjustment of $\delta_{i,p}$ (or $\delta_{i,p}^\sigma$) will cause the change of slope as shown in Figure 4.6 (b).

$$P_{i,pv}^\sigma = P_i^{max} \left(1 - \frac{1}{1 + \exp[-4(|V_i^\sigma| - V_{i,cri}^\sigma)/\delta_{i,p}^\sigma]} \right) \quad (4.3)$$

$$P_{i,pv} = P_i^{max} \left(1 - \frac{1}{1 + \exp \left[-4 \left(\frac{|V_i^A| + |V_i^B| + |V_i^C|}{3} - V_{i,cri} \right) / \delta_{i,p} \right]} \right) \quad (4.4)$$

$$P_i^{max} = \begin{cases} P_{i,MPP} & ; P_{i,MPP} \leq P_{i,rated} \\ P_{i,rated} & ; P_{i,MPP} > P_{i,rated} \end{cases} \quad (4.5)$$

where σ is any phase (A, B or C); V_i^σ is voltage at the connection point i of PV system (pu.); $V_{i,cri}$ (or $V_{i,cri}^\sigma$) and $\delta_{i,p}$ (or $\delta_{i,p}^\sigma$) are adjustable parameters at the connection point i of PV system.

(a) Adjustment of $V_{i,cri}$ and fix of $\delta_{i,p}$ that equals 0.05

(b) Adjustment of $\delta_{i,p}$ and fix of $V_{i,cri}$ that equals 1.05

Figure 4.6 Characteristic curve of $P(U)$ function when adjust $\delta_{i,p}$ or $V_{i,cri}$

For applying volt-var function or $Q(U)$ function in equations (4.6) and (4.7), the constant 1 which is the first term of equation (4.2) is replaced by $K_{i,1}^\sigma$ or $K_{i,1}$. The

constant 2 in the second term of equation (4.2) is replaced by $K_{i,2}^\sigma$ or $K_{i,2}$. The variable V_i is replaced by V_i^σ or $(V_i^A + V_i^B + V_i^C)/3$. The other constant 1 which is in term of exp is replaced by $V_{i,q}^\sigma$ or $V_{i,q}$. The variable δ_i in equation (4.2) is replaced by $\delta_{i,q}^\sigma$ or $\delta_{i,q}$. The equation (4.6) and (4.7) are for single and three phase PV inverter respectively. The adjustment of $K_{i,1}$ (or $K_{i,1}^\sigma$) and $K_{i,2}$ (or $K_{i,2}^\sigma$) will cause the change of reactive power output as shown in Figure 4.7 (a). The adjustment of $V_{i,q}$ (or $V_{i,q}^\sigma$) will cause the change of the voltage which initiates to absorb or inject reactive power as shown in Figure 4.7 (b). Finally, The adjustment of $\delta_{i,q}$ (or $\delta_{i,q}^\sigma$) will affect the slope as shown in Figure 4.7 (c).

$$Q_{i,pv}^\sigma = Q_i^{max} \left(K_{i,1}^\sigma - \frac{K_{i,2}^\sigma}{1 + \exp[-4 (|V_i^\sigma| - V_{i,q}^\sigma) / \delta_{i,q}^\sigma]} \right) \quad (4.6)$$

$$Q_{i,pv} = Q_i^{max} \left(K_{i,1} - \frac{K_{i,2}}{1 + \exp \left[-4 \left(\frac{|V_i^A| + |V_i^B| + |V_i^C|}{3} - V_{i,q} \right) / \delta_{i,q} \right]} \right) \quad (4.7)$$

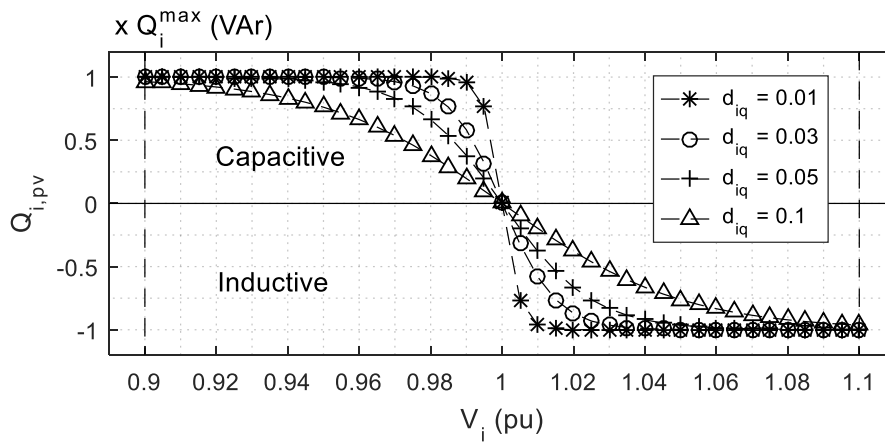

where $K_{i,1}$ (or $K_{i,1}^\sigma$), $K_{i,2}$ (or $K_{i,2}^\sigma$), $V_{i,q}$ (or $V_{i,q}^\sigma$) and $\delta_{i,q}$ (or $\delta_{i,q}^\sigma$) are adjustable parameters at the connection point j of PV system.

(a) Adjustment of $K_{i,1}$ and $K_{i,2}$ and fix of $V_{i,q}$ and $\delta_{i,q}$ which equal 1 and 0.05 respectively

(b) Adjustment of $V_{i,q}$ and fix of $K_{i,1}$, $K_{i,2}$ and $\delta_{i,q}$ which equal 1, 2 and 0.05 respectively

(c) Adjustment of $\delta_{i,q}$ and fix of $K_{i,1}$, $K_{i,2}$ and $V_{i,q}$ which equal 1, 2 and 1 respectively

Figure 4.7 Characteristic curve of $Q(U)$ function when adjust $K_{i,1}$, $K_{i,2}$, $V_{i,q}$ or $\delta_{i,q}$

4.4.1.2 Piecewise Linear Local Control Function

Research [11] and many local control applications [34, 35] use piecewise linear local control function as shown in Figure 4.8.

Figure 4.8 Piecewise linear local control function

For $P(U)$ function at Figure 4.8 (a), $V_{i,p1}$ (or $V_{i,p1}^\sigma$) and $V_{i,p2}$ (or $V_{i,p2}^\sigma$) are adjustable parameters. The equations (4.8) and (4.9) are applied for 1-phase and 3-phase PV systems respectively.

$$P_{i,pv}^\sigma = P_i^{max} \cdot \begin{cases} 1 & ; |V_i^\sigma| < V_{i,p1}^\sigma \\ \frac{|V_i^\sigma| - V_{i,p2}^\sigma}{V_{i,p1}^\sigma - V_{i,p2}^\sigma} & ; V_{i,p1}^\sigma \leq |V_i^\sigma| < V_{i,p2}^\sigma \\ 0 & ; V_{i,p2}^\sigma \leq |V_i^\sigma| \end{cases} \quad (4.8)$$

$$P_{i,pv} = P_i^{max} \cdot \begin{cases} 1 & ; |V_i| < V_{i,p1} \\ \frac{|V_i| - V_{i,p2}}{V_{i,p1} - V_{i,p2}} & ; V_{i,p1} \leq |V_i| < V_{i,p2} \\ 0 & ; V_{i,p2} \leq |V_i| \end{cases} \quad (4.9)$$

$$P_i^{max} = \begin{cases} P_{i,MPP} & ; P_{i,MPP} \leq P_{i,rated} \\ P_{i,rated} & ; P_{i,MPP} > P_{i,rated} \end{cases} \quad (4.10)$$

where $|V_i| = \frac{|V_i^A| + |V_i^B| + |V_i^C|}{3}$.

For $Q(U)$ function at Figure 4.8 (a), $K_{i,1}$ (or $K_{i,1}^\sigma$), $K_{i,2}$ (or $K_{i,2}^\sigma$), $V_{i,q1}$ (or $V_{i,q1}^\sigma$) and $V_{i,q2}$ (or $V_{i,q2}^\sigma$) are adjustable parameters. The equations (4.11) and (4.12) are applied for 1-phase and 3-phase PV systems respectively.

$$Q_{i,pv}^\sigma = Q_i^{max} \cdot \begin{cases} K_{i,1}^\sigma & ; |V_i^\sigma| < V_{i,q1}^\sigma \\ f_i^\sigma(x) & ; V_{i,q1}^\sigma \leq |V_i^\sigma| < V_{i,q2}^\sigma \\ K_{i,2}^\sigma & ; V_{i,q2}^\sigma \leq |V_i^\sigma| \end{cases} \quad (4.11)$$

$$Q_{i,pv} = Q_i^{max} \cdot \begin{cases} K_{i,1} & ; |V_i| < V_{i,q1} \\ f_i(x) & ; V_{i,q1} \leq |V_i| < V_{i,q2} \\ K_{i,2} & ; V_{i,q2} \leq |V_i| \end{cases} \quad (4.12)$$

where $f_i^\sigma(x) = \frac{(K_{i,1}^\sigma - K_{i,2}^\sigma)|V_i^\sigma| + K_{i,2}^\sigma \cdot V_{i,q1}^\sigma - K_{i,1}^\sigma \cdot V_{i,q2}^\sigma}{V_{i,q1}^\sigma - V_{i,q2}^\sigma}$; $f_i(x) = \frac{(K_{i,1} - K_{i,2})|V_i| + K_{i,2} \cdot V_{i,q1} - K_{i,1} \cdot V_{i,q2}}{V_{i,q1} - V_{i,q2}}$;

$$|V_i| = \frac{|V_i^A| + |V_i^B| + |V_i^C|}{3}$$

4.4.1.3 Operational Region of Local Control

According to the manual [34], the operational region of local control of SMA PV inverter can be shown in Figure 4.9 which local control will operate on blue-shaded area at normal condition. $P_{i,rated}$ and $S_{i,rated}$ are the specified rated real and apparent power output of PV system at node i respectively. $Q_{i,max}$ is the maximum reactive power output that equals $0.5 \times P_{i,rated}$.

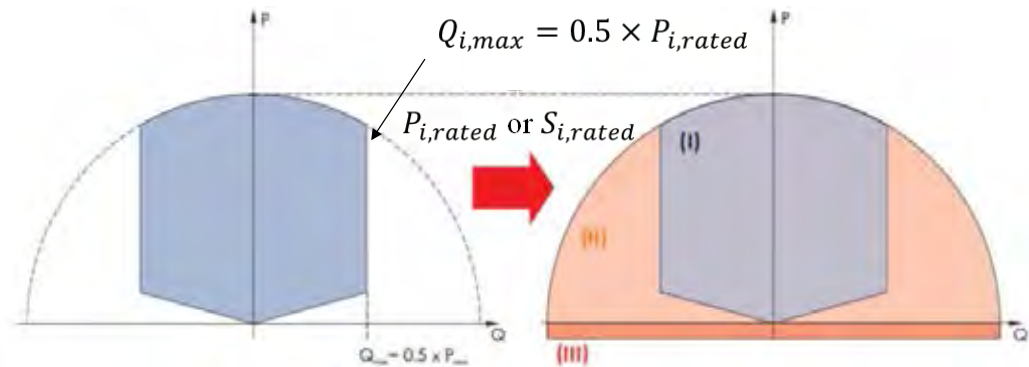

Figure 4.9 The operation region of local control of SMA PV inverter

To simplify the operational region in Figure 4.9, this dissertation determines the operational region as shown in Figure 4.10 that local control will operate on shaded area which real power output will be not more than $P_{i,rated}$ or the maximum allowable real power output which can be determined from equation (4.5) or equation (4.10).

Figure 4.10 The operational region of local control

4.4.2 Central Control Application

From research [36], it presents central control as shown in Figure 4.8 that contains 4 main parts such as (1) monitoring part of Advanced Metering Infrastructure (AMI) and ambient weather condition, (2) simulation part of distribution system model, (3) decision part to control PV system and (4) communication part to PV system.

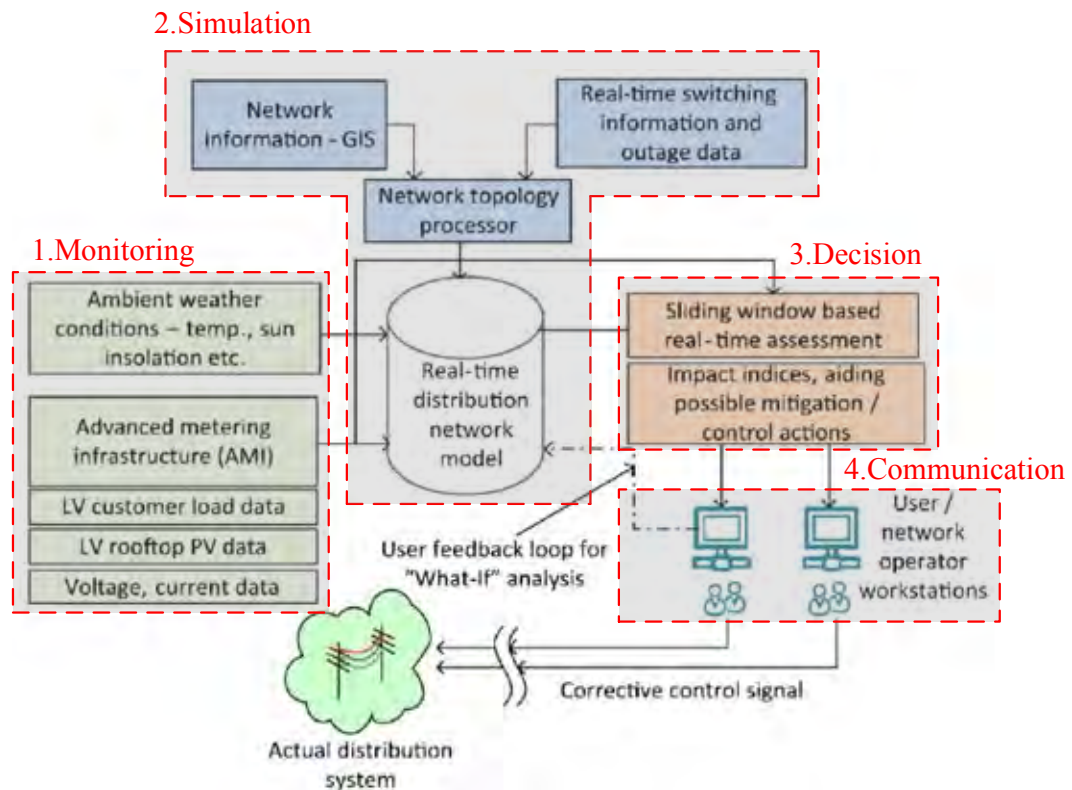

Figure 4.11 Central control diagram of research [36]

In this research, the modified central control is presented in Figure 4.9 that contains 5 main parts such as (1) communication part to PV system, (2) uncertainty analysis, (3) PV system model, (4) LV grid model and (5) decision or optimization part. For optimization part, it will be addressed later in Chapter 5.

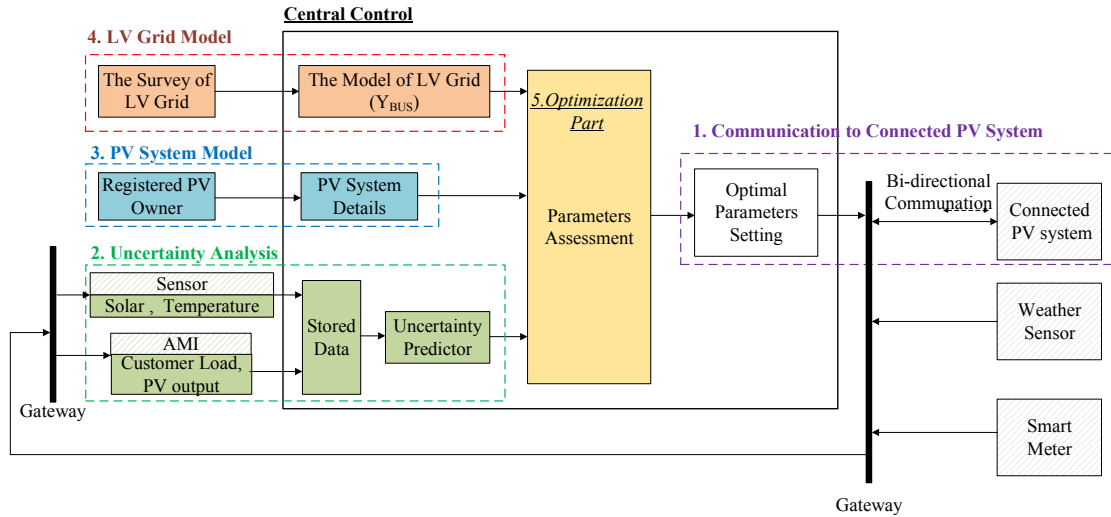

Figure 4.12 The modified central control

4.4.2.1 Communication Part to Connected PV System

This part is communication system between central control and connected PV system to send optimal parameter setting to local control of connected PV system. The optimal parameters setting will be obtained from optimization part which will be addressed later in Chapter 5. The parameters setting will depend on type of local control as shown in Tables 4.1 and 4.2 where npv is the total number of connected PV systems.

Table 4.1 The parameters setting of continuous local control function

| PV | Local Control | | | | | |
|-----------------|---------------|------------------|---------------|-------------|-------------|------------------|
| | P(U) Function | | Q(U) Function | | | |
| 1 st | $V_{1,cri}$ | $\delta_{1,p}$ | $K_{1,1}$ | $K_{1,2}$ | $V_{1,q}$ | $\delta_{1,q}$ |
| 2 nd | $V_{2,cri}$ | $\delta_{2,p}$ | $K_{2,1}$ | $K_{2,2}$ | $V_{2,q}$ | $\delta_{2,q}$ |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |

4.4.2.2 Uncertainty Analysis Unit

This part collects data from AMI, which can monitor load of customer, and weather sensor, which can monitor ambient condition such as solar irradiance and ambient temperature to assess the operation of connected PV system. The uncertainty characteristic will be assessed or predicted in one day or one week ahead from the collected data in the previous period. The collected data will be assessed into uncertainty characteristic as shown in equation (4.13) which is normal distribution probability. Figure 4.14 (a) shows the example of collected data and Figure 4.14 (b) shows the transformed normal distribution curve with maximum, mean, and minimum data.

$$f(x) = \frac{1}{\sqrt{2\rho^2\pi}} e^{-\frac{(x-\mu)^2}{2\rho^2}} ; x_{min} \leq x \leq x_{max} \quad (4.13)$$

where ρ is standard deviation value; μ is mean value; x is collected data value; x_{min} and x_{max} are minimum and maximum collected data value.

(a) *The collected data*(b) *Transformed normal distribution curve**Figure 4.13 The example of normal distribution determination*

This research determines 3-phase unbalance LV distribution system, connected with PV system. Then, 17 cases of the set of uncertainty will be determined to cover uncertainty problem as shown in Table 4.2. For minimum MPP of connected PV system, solar irradiance at 0.05 kW/m^2 [20] is considered because it is initial condition that PV system initiates to operate.

Table 4.3 Set of uncertainty for covering uncertainty problem

| Case | Load | | | MPP of connected PV system |
|------|---------|---------|---------|----------------------------|
| | Phase A | Phase B | Phase C | |

4.4.2.3 PV System Model Determination

Central control needs to collect PV system details of customers for assessing the power generation from PV system. For example, Tables 4.4 and 4.5 show 2-kW and 10-kW PV system details respectively.

Table 4.4 2-kW PV system details

| Parameters | Values | Parameters | Values |
|------------------------------|------------------------------|---------------------------------------|-----------|
| V_{oc}^0 at Nominal Cell | 42.3 V | V_{MPP}^0 at NOCT | 33.7 V |
| Operating Temperature (NOCT) | | | |
| I_{sc}^0 at NOCT | 7.16 A | I_{MPP}^0 at NOCT | 6.56 A |
| NOCT (N_{OT}) | 45 °C | Number of PV panel | 12 panels |
| K_i | 5.3×10^{-3} A/°C | Rated real power of PV inverter | 2,000 W |
| K_v | -1.404×10^{-1} V/°C | Maximum reactive power of PV inverter | 1,000 VAr |

Table 4.5 10-kW PV system details

| Parameters | Values | Parameters | Values |
|--------------------|------------------------------|---------------------------------------|-----------|
| V_{oc}^0 at NOCT | 42.3 V | V_{MPP}^0 at NOCT | 33.7 V |
| I_{sc}^0 at NOCT | 7.16 A | I_{MPP}^0 at NOCT | 6.56 A |
| NOCT (N_{OT}) | 45 °C | Number of PV panel | 58 panels |
| K_i | 5.3×10^{-3} A/°C | Rated real power of PV inverter | 10,000 W |
| K_v | -1.404×10^{-1} V/°C | Maximum reactive power of PV inverter | 5,000 VAr |

If 2-kW PV system connects to phase A and voltage at this connection point is $1.09\angle 0^\circ$ pu. Base system voltage is 230 V, line to neutral. The parameters setting of continuous local control function is follows: V_{cri} , δ_p , K_1 , K_2 , V_q and δ_q are 1.09, 0.02, 1, 2, 1 and 0.05 respectively. Solar irradiance and ambient temperature are 1 kW/m^2 and 30°C respectively. Then, power output of this 2-kW PV system can be assessed in 3 steps as follows.

STEP 1: P_{rated} is 2,000 W. P_{MPP} will be 2,539.97 W according to the calculation in equations (2.1)-(2.5).

STEP 2: From equation (4.5), P^{max} will be 2,000 W.

STEP 3: According to P(U) function as shown in equation (4.3), P_{pv}^A is 1,000 W. According to Q(U) function as shown in equation (4.6), Q_{pv}^A is -998.51 VAr. Then, apparent power output from this 2-kW PV system is 1,000-j998.51 VA.

If 10-kW PV system connects to phases A, B and C under voltage $1.09\angle 0^\circ$, $1.085\angle -120^\circ$ and $1.095\angle 120^\circ$ pu. respectively. Base system voltage is 230 V, line to neutral. The parameters setting of V_{cri} , δ_p , K_1 , K_2 , V_q and δ_q equal 1.09, 0.02, 1, 2, 1 and 0.05 respectively. Then, power output of this 10-kW PV system can be assessed in 4 steps as follows.

STEP 1: P_{rated} is 10,000 W. P_{MPP} will be 12,276.51 W according to the calculation in equations (2.1)-(2.5).

STEP 2: From equation (4.5), P^{max} will be 10,000 W.

STEP 3: According to P(U) function as shown in equation (4.4), P_{pv} is 5,000 W. According to Q(U) function as shown in equation (4.7), Q_{pv} is -4,992.54 VAR. Then, total apparent power output from this 10-kW PV system is 5,000-j4,992.54 VA.

STEP 4: Since this is a three phase PV system, power output from each phase can be calculated from equations (2.6)-(2.8). $P_{pv}^A + jQ_{pv}^A$, $P_{pv}^B + jQ_{pv}^B$ and $P_{pv}^C + jQ_{pv}^C$ will be 1,666.67-j1,664.18, 1,659.02-j1,656.55 and 1,674.31-j1,671.81 VA respectively.

4.4.2.3 LV Grid Model Determination

As any wiring configuration, the calculation of self and mutual impedance can apply modified Carson's equations, as given in [37, 38], that are reprinted in equation (4.14) and (4.15).

$$z^{\sigma\sigma} = r^{\sigma} + 0.00158836 \cdot f + j0.00202237 \cdot f \cdot \left(\ln \frac{1}{GMR^{\sigma}} + 7.6786 + \frac{1}{2} \ln \frac{p_g}{f} \right) \quad (4.14)$$

$$z^{\sigma\sigma'} = 0.00158836 \cdot f + j0.00202237 \cdot f \cdot \left(\ln \frac{1}{D^{\sigma\sigma'}} + 7.6786 + \frac{1}{2} \ln \frac{p_g}{f} \right) \quad (4.15)$$

$$GMR^{\sigma} = r_c^{\sigma} \cdot \exp(-0.25) \quad (4.16)$$

where $z^{\sigma\sigma}$ is self impedance of conductor phase σ (Ω /mile); $z^{\sigma\sigma'}$ is mutual impedance between conductor phase σ and σ' (Ω /mile); r^{σ} is resistance of conductor phase σ (Ω); GMR^{σ} is Geometric Mean Radius of conductor phase σ (feet); $D^{\sigma\sigma'}$ is distance between conductor phase σ and σ' (feet); p_g is earth resistivity (Ω -m); f is frequency (Hz); r_c^{σ} is radius of conductor of any phase σ (feet).

For most applications, the primitive impedance matrix needs to be reduced to 3x3 matrix consisting of the self and mutual equivalent impedances for the three phases. LV branch is normally a four-wire grounded as shown in Figure 4.15 and branch impedance Z_{branch} can be shown in equation (4.17). However, the line have multi-

grounded or V^{NG} and $V^{NG'}$ equal to zero. Then, Kron reduction [38] can be applied to reduce to 3x3 matrix. For Y_{bus} formulation, it can be calculated from text book [39].

Figure 4.14 Four-wires grounded branch

$$Z_{branch} = \begin{bmatrix} z^{AA} & z^{AB} & z^{AC} & z^{AN} \\ z^{AB} & z^{BB} & z^{BC} & z^{BN} \\ z^{AC} & z^{BC} & z^{CC} & z^{CN} \\ z^{AN} & z^{BN} & z^{CN} & z^{NN} \end{bmatrix} \quad (4.17)$$

Assuming a LV line in Figure 4.16, the details is as follows.

- Line spacing between phase conductors is 20 cm that can be shown in Figure 4.16.
- Utilizing polyethylene insulated weatherproof aluminum conductors and the parameter can be shown in Table 4.8.
- Phase A, B, C and neutral use conductor size as 70, 70, 70 and 35 mm².

Table 4.6 The parameters of polyethylene insulated weatherproof aluminum conductors [40]

| Conductor Size (mm ²) | Conductor radius (mm) | Ampacities at 75°C (A) | Resistance at 75°C (Ω) |
|-----------------------------------|-----------------------|------------------------|------------------------|
| 35 | 3.30 | 190 | 1.0606 |
| 75 | 4.65 | 300 | 0.5414 |

From Figure 4.16, Z_{branch} calculation can be divided in 5 steps as follows.

STEP 1: Find GMR^A , GMR^B , GMR^C and GMR^N from equation (4.16) and they can be obtained as follows.

$$GMR^A = GMR^B = GMR^C = 0.0119 \text{ feet} \quad (4.18)$$

$$GMR^N = 0.0084 \text{ feet} \quad (4.19)$$

Figure 4.15 LV line configuration

STEP 2: Find self impedance from equation (4.14) and they can be obtained as follows.

$$z^{AA} = z^{BB} = z^{CC} = 0.6208 + j1.2597 \text{ ohms/mile} \quad (4.20)$$

$$z^{NN} = 1.1400 + j1.2944 \text{ ohms/mile} \quad (4.21)$$

STEP 3: Find mutual impedance from equation (4.15) and they can be obtained as follows.

$$z^{AN} = z^{AB} = z^{BC} = 0.0794 + j0.8541 \text{ ohms/mile} \quad (4.22)$$

$$z^{BN} = z^{AC} = 0.0794 + j0.7840 \text{ ohms/mile} \quad (4.23)$$

$$z^{CN} = 0.0794 + j0.7430 \text{ ohms/mile} \quad (4.24)$$

STEP 4: Z_{branch} can be formulated as follows.

$$Z_{branch} = \begin{bmatrix} 0.6208 + j1.2597 & 0.0794 + j0.8541 & 0.0794 + j0.7840 & 0.0794 + j0.8541 \\ 0.0794 + j0.8541 & 0.6208 + j1.2597 & 0.0794 + j0.8541 & 0.0794 + j0.7840 \\ 0.0794 + j0.7840 & 0.0794 + j0.8541 & 0.6208 + j1.2597 & 0.0794 + j0.7430 \\ 0.0794 + j0.8541 & 0.0794 + j0.7840 & 0.0794 + j0.7430 & 1.1400 + j1.2944 \end{bmatrix} \quad (4.25)$$

ohms/mile

STEP 5: Kron reduction is applied to reduce into 3x3 matrix due to neutral line is connected by multi-ground or neutral-ground voltage equal to zero.

195938377

$$Z_{branch} = \begin{bmatrix} 0.8389 + j0.8931 & 0.2770 + j0.5157i & 0.2650 + j0.4621 \\ 0.2770 + j0.5157 & 0.8000 + j0.9473 & 0.2475 + j0.5569 \\ 0.2650 + j0.4621 & 0.2475 + j0.5569 & 0.7786 + 0.9771i \end{bmatrix} \quad (4.26)$$

ohms/mile

195938377

CHAPTER 5

OPTIMIZATION PROCESS

This chapter will address the power flow algorithm with using local control function and 2-stage Particle Swarm Optimization (PSO) which is used for finding the optimal parameter setting of local control.

5.1 The Power Flow Algorithm with Using Local Control Function

Normally, equivalent real and reactive power equation of three-phase electrical system, where there is no PV system connection, can be written into equations (5.1)-(5.4) [41] as follows.

$$P_{i,load}^{\sigma} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} |V_i^{\sigma}| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \quad (5.1)$$

$$Q_{i,load}^{\sigma} = - \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} |V_i^{\sigma}| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \quad (5.2)$$

$$|Y_{ij}| = \begin{bmatrix} |Y_{ij}^{AA}| & |Y_{ij}^{AB}| & |Y_{ij}^{AC}| \\ |Y_{ij}^{AB}| & |Y_{ij}^{BB}| & |Y_{ij}^{BC}| \\ |Y_{ij}^{AC}| & |Y_{ij}^{BC}| & |Y_{ij}^{CC}| \end{bmatrix} \quad (5.3)$$

$$\theta_{ij} = \begin{bmatrix} \theta_{ij}^{AA} & \theta_{ij}^{AB} & \theta_{ij}^{AC} \\ \theta_{ij}^{AB} & \theta_{ij}^{BB} & \theta_{ij}^{BC} \\ \theta_{ij}^{AC} & \theta_{ij}^{BC} & \theta_{ij}^{CC} \end{bmatrix} \quad (5.4)$$

where $P_{i,load}^{\sigma}$ is real power load at node i , phase σ (pu.); $Q_{i,load}^{\sigma}$ is reactive power load at node i , phase σ (pu.); σ and σ' are any phase A or B or C; $|Y_{ij}|$ is the absolute value of admittance matrix between nodes i and j (pu.); θ_{ij} is phase angle of admittance matrix between nodes i and j (radians); n is number of overall nodes in LV distribution system; $|V_i^{\sigma}|$ is the magnitude of voltage at node i , phase σ (pu.); δ_i^{σ} is the phase angle at node i , phase σ (radians).

Equations (5.1) and (5.2) constitute a set of nonlinear algebraic equations in terms of the independent variables, voltage magnitude in per unit, and phase angle in

radians. Expanding equations (5.1) and (5.2) in Taylor's series about the initial estimate and neglecting all higher order terms results in the linear equations as shown in equation (5.5). Node 1 is assumed to be a slack node. Moreover, newton-raphson method need to solve equation (5.5) until ΔP_i^{ABC} and ΔQ_i^{ABC} nearly equal to zero.

$$\begin{bmatrix} \Delta P_2^{ABC} \\ \vdots \\ \Delta P_n^{ABC} \\ \hline \Delta Q_2^{ABC} \\ \vdots \\ \Delta Q_n^{ABC} \end{bmatrix} = \begin{bmatrix} \frac{\partial P_2^{ABC}}{\partial \delta_2^{ABC}} & \cdots & \frac{\partial P_2^{ABC}}{\partial \delta_n^{ABC}} & \left| \frac{\partial P_2^{ABC}}{\partial |V_2^{ABC}|} \right| & \cdots & \left| \frac{\partial P_2^{ABC}}{\partial |V_n^{ABC}|} \right| \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ \frac{\partial P_n^{ABC}}{\partial \delta_2^{ABC}} & \cdots & \frac{\partial P_n^{ABC}}{\partial \delta_n^{ABC}} & \left| \frac{\partial P_n^{ABC}}{\partial |V_2^{ABC}|} \right| & \cdots & \left| \frac{\partial P_n^{ABC}}{\partial |V_n^{ABC}|} \right| \\ \hline \frac{\partial Q_2^{ABC}}{\partial \delta_2^{ABC}} & \cdots & \frac{\partial Q_2^{ABC}}{\partial \delta_n^{ABC}} & \left| \frac{\partial Q_2^{ABC}}{\partial |V_2^{ABC}|} \right| & \cdots & \left| \frac{\partial Q_2^{ABC}}{\partial |V_n^{ABC}|} \right| \\ \vdots & \ddots & \vdots & \vdots & \ddots & \vdots \\ \frac{\partial Q_n^{ABC}}{\partial \delta_2^{ABC}} & \cdots & \frac{\partial Q_n^{ABC}}{\partial \delta_n^{ABC}} & \left| \frac{\partial Q_n^{ABC}}{\partial |V_2^{ABC}|} \right| & \cdots & \left| \frac{\partial Q_n^{ABC}}{\partial |V_n^{ABC}|} \right| \end{bmatrix} \begin{bmatrix} \Delta \delta_2^{ABC} \\ \vdots \\ \Delta \delta_n^{ABC} \\ \hline \Delta |V_2^{ABC}| \\ \vdots \\ \Delta |V_n^{ABC}| \end{bmatrix} \quad (5.5)$$

$$\Delta P_2^{ABC} = \begin{bmatrix} \Delta P_2^A \\ \Delta P_2^B \\ \Delta P_2^C \end{bmatrix}; \Delta Q_2^{ABC} = \begin{bmatrix} \Delta Q_2^A \\ \Delta Q_2^B \\ \Delta Q_2^C \end{bmatrix}; \Delta \delta_2^{ABC} = \begin{bmatrix} \Delta \delta_2^A \\ \Delta \delta_2^B \\ \Delta \delta_2^C \end{bmatrix}; \Delta |V_2^{ABC}| = \begin{bmatrix} \Delta |V_2^A| \\ \Delta |V_2^B| \\ \Delta |V_2^C| \end{bmatrix} \quad (5.6)$$

In equation (5.5), the Jacobian matrix gives the linearized relationship between small changes in voltage angle $\Delta \delta_i^{ABC}$ and voltage magnitude $\Delta |V_i^{ABC}|$ with the small changes in real and reactive power ΔP_i^{ABC} and ΔQ_i^{ABC} . Elements of the Jacobian matrix are the partial derivatives of equations (5.1) and (5.2), evaluated at $\Delta \delta_i^{ABC}$ and $\Delta |V_i^{ABC}|$. In short form, it can be written in equation (5.7).

$$\begin{bmatrix} \Delta P \\ \Delta Q \end{bmatrix} = \begin{bmatrix} J_1 & J_2 \\ J_3 & J_4 \end{bmatrix} \begin{bmatrix} \Delta \delta \\ \Delta |V| \end{bmatrix} \quad (5.7)$$

The diagonal and the off-diagonal elements of J_1 are the followings.

$$\frac{\partial P_{i,load}^\sigma}{\partial \delta_i^\sigma} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} |V_i^\sigma| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma + \delta_j^{\sigma'}) \quad (5.8)$$

$$\frac{\partial P_{i,load}^\sigma}{\partial \delta_j^{\sigma'}} = -|V_i^\sigma| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma + \delta_j^{\sigma'}); \sigma \neq \sigma' \& i \neq j \quad (5.9)$$

where j is any node in LV system.

The diagonal and the off-diagonal elements of J_2 are the followings.

$$\begin{aligned} \frac{\partial P_{i,load}^{\sigma}}{\partial |V_i^{\sigma}|} &= 2|V_i^{\sigma}||Y_{ii}^{\sigma\sigma}| \cos(\theta_{ii}^{\sigma\sigma}) \\ &+ \sum_{j=1}^n \sum_{\substack{\sigma \neq \sigma' & i \neq j \\ \sigma' \in \{A,B,C\}}} |V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \end{aligned} \quad (5.10)$$

$$\frac{\partial P_{i,load}^{\sigma}}{\partial |V_j^{\sigma'}|} = |V_i^{\sigma}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}); \sigma \neq \sigma' & i \neq j \quad (5.11)$$

The diagonal and the off-diagonal elements of J_3 are the followings.

$$\frac{\partial Q_{i,load}^{\sigma}}{\partial \delta_i^{\sigma}} = \sum_{j=1}^n \sum_{\substack{\sigma \neq \sigma' & i \neq j \\ \sigma' \in \{A,B,C\}}} |V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \quad (5.12)$$

$$\frac{\partial Q_{i,load}^{\sigma}}{\partial \delta_j^{\sigma'}} = -|V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}); \sigma \neq \sigma' & i \neq j \quad (5.13)$$

The diagonal and the off-diagonal elements of J_4 are the followings.

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial |V_i^{\sigma}|} &= -2|V_i^{\sigma}||Y_{ii}^{\sigma\sigma}| \sin(\theta_{ii}^{\sigma\sigma}) \\ &- \sum_{m=1}^n \sum_{\substack{\sigma \neq \sigma' & i \neq j \\ \sigma' \in \{A,B,C\}}} |V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \end{aligned} \quad (5.14)$$

$$\frac{\partial Q_{i,load}^{\sigma}}{\partial |V_j^{\sigma'}|} = -|V_i^{\sigma}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}); \sigma \neq \sigma' & i \neq j \quad (5.15)$$

In the case of having connected single phase PV inverters in the phase A, B or C at any node i , equivalent real and reactive power equation of three-phase electrical system can be written in equations (5.16)-(5.17).

$$P_{i,load}^{\sigma} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} |V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - P_{i,pv}^{\sigma} \quad (5.16)$$

$$Q_{i,load}^{\sigma} = - \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} |V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - Q_{i,pv}^{\sigma} \quad (5.17)$$

From equations (5.16)-(5.17), it can be transformed to the linear equations as shown in equation (5.7). The diagonal and the off-diagonal elements of J_1 are the followings.

$$\frac{\partial P_{i,load}^{\sigma}}{\partial \delta_i^{\sigma}} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} |V_i^{\sigma}| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \quad (5.18)$$

$$\frac{\partial P_{i,load}^{\sigma}}{\partial \delta_j^{\sigma'}} = -|V_i^{\sigma}| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}); \sigma \neq \sigma' \& i \neq j \quad (5.19)$$

The diagonal and the off-diagonal elements of J_2 are shown in equations (5.20) and (5.21) respectively where equations (5.22) and (5.23) are the differential equations of continuous and piecewise linear P(U) local control functions respectively.

$$\begin{aligned} \frac{\partial P_{i,load}^{\sigma}}{\partial |V_i^{\sigma}|} &= 2|V_i^{\sigma}| |Y_{ii}^{\sigma\sigma}| \cos(\theta_{ii}^{\sigma\sigma}) \\ &+ \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - \frac{\partial P_{i,pv}^{\sigma}}{\partial |V_i^{\sigma}|} \end{aligned} \quad (5.20)$$

$$\frac{\partial P_{i,load}^{\sigma}}{\partial |V_j^{\sigma'}|} = |V_i^{\sigma}| |Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}); \sigma \neq \sigma' \& i \neq j \quad (5.21)$$

$$\frac{\partial P_{i,pv}^{\sigma}}{\partial |V_i^{\sigma}|} = \frac{-4 \cdot P_i^{max} \cdot \exp[-4(|V_i^{\sigma}| - V_{i,cri}^{\sigma})/\delta_{i,p}^{\sigma}]}{\delta_{i,p}^{\sigma} \cdot [1 + \exp[-4(|V_i^{\sigma}| - V_{i,cri}^{\sigma})/\delta_{i,p}^{\sigma}]]^2} \quad (5.22)$$

$$\frac{\partial P_{i,pv}^{\sigma}}{\partial |V_i^{\sigma}|} = P_i^{max} \cdot \begin{cases} \frac{1}{V_{i,p1}^{\sigma} - V_{i,p2}^{\sigma}}; & V_{i,p1}^{\sigma} \leq |V_i^{\sigma}| < V_{i,p2}^{\sigma} \\ 0 & ; \text{other} \end{cases} \quad (5.23)$$

The diagonal and the off-diagonal elements of J_3 are the followings.

$$\frac{\partial Q_{i,load}^{\sigma}}{\partial \delta_i^{\sigma}} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} |V_i^{\sigma}| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \quad (5.24)$$

$$\frac{\partial Q_{i,load}^{\sigma}}{\partial \delta_j^{\sigma'}} = -|V_i^{\sigma}| |V_j^{\sigma'}| |Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}); \sigma \neq \sigma' \& i \neq j \quad (5.25)$$

The diagonal and the off-diagonal elements of J_4 are shown in equations (5.26) and (5.27) respectively where equations (5.28) and (5.29) are the differential equations of continuous and piecewise linear Q(U) local control functions respectively.

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial |V_i^{\sigma}|} &= -2|V_i^{\sigma}||Y_{ii}^{\sigma\sigma}| \sin(\theta_{ii}^{\sigma\sigma}) \\ &\quad - \sum_{m=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} |V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) \\ &\quad - \frac{\partial Q_{i,pv}^{\sigma}}{\partial |V_i^{\sigma}|} \end{aligned} \quad (5.26)$$

$$\frac{\partial Q_{i,load}^{\sigma}}{\partial |V_j^{\sigma'}|} = -|V_i^{\sigma}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}); \sigma \neq \sigma' \& i \neq j \quad (5.27)$$

$$\frac{\partial Q_{i,pv}^{\sigma}}{\partial |V_i^{\sigma}|} = \frac{-4 \cdot K_{i,2}^{\sigma} \cdot Q_i^{max} \cdot \exp[-4(|V_i^{\sigma}| - V_{i,q}^{\sigma})/\delta_{i,q}^{\sigma}]}{\delta_{i,q}^{\sigma} \cdot [1 + \exp[-4(|V_i^{\sigma}| - V_{i,q}^{\sigma})/\delta_{i,q}^{\sigma}]]^2} \quad (5.28)$$

$$\frac{\partial Q_{i,pv}^{\sigma}}{\partial |V_i^{\sigma}|} = Q_i^{max} \cdot \begin{cases} \frac{K_{i,1}^{\sigma} - V_{i,2}^{\sigma}}{V_{i,q1}^{\sigma} - V_{i,q2}^{\sigma}}; & V_{i,q1}^{\sigma} \leq |V_i^{\sigma}| < V_{i,q2}^{\sigma} \\ 0 & ; \text{other} \end{cases} \quad (5.29)$$

In the case of having connected three phase PV inverters in the phases A, B and C at any node i , equivalent real and reactive power equation of three-phase electrical system can be written in equations (5.30)-(5.31).

$$P_{i,load}^{\sigma} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} |V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - P_{i,pv}^{\sigma} \quad (5.30)$$

$$Q_{i,load}^{\sigma} = - \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} |V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - Q_{i,pv}^{\sigma} \quad (5.31)$$

From equation (5.30)-(5.31), it can be transformed to the linear equations as shown in equation (5.7). The diagonal and the off-diagonal elements of J_1 can be written into equations (5.32) and (5.33) respectively where $\frac{\partial P_{i,pv}^{\sigma}}{\partial \delta_i^{\sigma}}$ and $\frac{\partial P_{i,pv}^{\sigma}}{\partial \delta_j^{\sigma'}}$ can be clarified in

Appendix B.1.

$$\frac{\partial P_{i,load}^{\sigma}}{\partial \delta_i^{\sigma}} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} |V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - \frac{\partial P_{i,pv}^{\sigma}}{\partial \delta_i^{\sigma}} \quad (5.32)$$

$$\frac{\partial P_{i,load}^{\sigma}}{\partial \delta_j^{\sigma'}} = -|V_i^{\sigma}||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - \frac{\partial P_{i,pv}^{\sigma}}{\partial \delta_j^{\sigma'}} \quad (5.33)$$

; $\sigma \neq \sigma' & i \neq j$

The diagonal and the off-diagonal elements of J_2 can be written in equations

(5.34) and (5.35) respectively where $\frac{\partial P_{i,pv}^\sigma}{\partial |V_i^\sigma|}$ and $\frac{\partial P_{i,pv}^\sigma}{\partial |V_j^{\sigma'}|}$ can be clarified in Appendix B.1.

$$\begin{aligned} \frac{\partial P_{i,load}^\sigma}{\partial |V_i^\sigma|} &= 2|V_i^\sigma||Y_{ii}^{\sigma\sigma}| \cos(\theta_{ii}^{\sigma\sigma}) \\ &+ \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' & i \neq j} |V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma + \delta_j^{\sigma'}) \\ &- \frac{\partial P_{i,pv}^\sigma}{\partial |V_i^\sigma|} \end{aligned} \quad (5.34)$$

$$\frac{\partial P_{i,load}^\sigma}{\partial |V_j^{\sigma'}|} = |V_i^\sigma||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma + \delta_j^{\sigma'}) - \frac{\partial P_{i,pv}^\sigma}{\partial |V_j^{\sigma'}|}; \sigma \neq \sigma' & i \neq j \quad (5.35)$$

The diagonal and the off-diagonal elements of J_3 can be written into equation

(5.36) and (5.37) respectively where $\frac{\partial Q_{i,pv}^\sigma}{\partial \delta_i^\sigma}$ and $\frac{\partial Q_{i,pv}^\sigma}{\partial \delta_j^{\sigma'}}$ can be clarified in Appendix B.1.

$$\frac{\partial Q_{i,load}^\sigma}{\partial \delta_i^\sigma} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' & i \neq j} |V_i^\sigma||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma + \delta_j^{\sigma'}) - \frac{\partial Q_{i,pv}^\sigma}{\partial \delta_i^\sigma} \quad (5.36)$$

$$\frac{\partial Q_{i,load}^\sigma}{\partial \delta_j^{\sigma'}} = -|V_i^\sigma||V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \cos(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma + \delta_j^{\sigma'}) - \frac{\partial Q_{i,pv}^\sigma}{\partial \delta_j^{\sigma'}} \quad (5.37)$$

; $\sigma \neq \sigma' & i \neq j$

The diagonal and the off-diagonal elements of J_4 can be written in equations

(5.38) and (5.39) respectively where $\frac{\partial Q_{i,pv}^\sigma}{\partial |V_i^\sigma|}$ and $\frac{\partial Q_{i,pv}^\sigma}{\partial |V_j^{\sigma'}|}$ can be clarified in Appendix B.1.

$$\begin{aligned} \frac{\partial Q_{i,load}^\sigma}{\partial |V_i^\sigma|} &= -2|V_i^\sigma||Y_{ii}^{\sigma\sigma}| \sin(\theta_{ii}^{\sigma\sigma}) \\ &- \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' & i \neq j} |V_j^{\sigma'}||Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma + \delta_j^{\sigma'}) \\ &- \frac{\partial Q_{i,pv}^\sigma}{\partial |V_i^\sigma|} \end{aligned} \quad (5.38)$$

$$\frac{\partial Q_{i,load}^{\sigma}}{\partial |V_j^{\sigma'}|} = -|V_i^{\sigma}| |Y_{ij}^{\sigma\sigma'}| \sin(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} + \delta_j^{\sigma'}) - \frac{\partial Q_{i,pv}^{\sigma}}{\partial |V_j^{\sigma'}|} \quad (5.39)$$

; $\sigma \neq \sigma' \text{ \& } i \neq m$

The terms $\Delta P_i^{\sigma(k)}$ and $\Delta Q_i^{\sigma(k)}$ are the difference between the scheduled and calculated values, known as the power residuals, given by:

$$\Delta P_i^{\sigma(k)} = P_i^{\sigma sch} - P_i^{\sigma(k)} \quad (5.40)$$

$$\Delta Q_i^{\sigma(k)} = Q_i^{\sigma sch} - Q_i^{\sigma(k)} \quad (5.41)$$

The new estimates for bus voltages and phase angles are:

$$\delta_i^{\sigma(k+1)} = \delta_i^{\sigma(k)} + w_{\delta_i^{\sigma}}^{(h-1) \text{ or } h} \cdot \Delta \delta_i^{\sigma(k)} \quad (5.42)$$

$$|V_i^{\sigma(k+1)}| = |V_i^{\sigma(k)}| + w_{V_i^{\sigma}}^{(h-1) \text{ or } h} \cdot \Delta |V_i^{\sigma(k)}| \quad (5.43)$$

where w is step-length value.

Substituting equation (5.42) for δ_i^{σ} and δ_j^{σ} in equations (5.8) and (5.9) and substituting equation (5.43) for $|V_i^{\sigma}|$ and $|V_j^{\sigma}|$ in equations (5.8) and (5.9):

$$P_{i,load}^{\sigma} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta |V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \cdot \Delta |V_j^{\sigma'}| \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta \delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta \delta_j^{\sigma'} \right) \quad (5.44)$$

$$Q_{i,load}^{\sigma} = - \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta |V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \cdot \Delta |V_j^{\sigma'}| \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta \delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta \delta_j^{\sigma'} \right) \quad (5.45)$$

Expanding equations (5.44) and (5.45) in Taylor's series about the initial estimate and neglecting all higher order terms results in the linear equations leads to equation (5.46), The diagonal and the off-diagonal elements of J_1 are shown in equations (5.47) and (5.48) respectively.

$$\begin{bmatrix} \Delta P \\ \Delta Q \end{bmatrix} = \begin{bmatrix} J_1 & J_2 \\ J_3 & J_4 \end{bmatrix} \begin{bmatrix} \Delta w_{\delta} \\ \Delta w_V \end{bmatrix} \quad (5.46)$$

$$\begin{aligned} \frac{\partial P_{i,load}^\sigma}{\partial w_{\delta_i^\sigma}} &= \Delta \delta_i^\sigma \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta |V_i^\sigma| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta |V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \cdot \Delta \delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta \delta_j^{\sigma'} \left. \right) \end{aligned} \quad (5.47)$$

$$\begin{aligned} \frac{\partial P_{i,load}^\sigma}{\partial w_{\delta_j^{\sigma'}}} &= -\Delta \delta_j^{\sigma'} \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta |V_i^\sigma| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta |V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \cdot \Delta \delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta \delta_j^{\sigma'} \left. \right); \sigma \neq \sigma' \& i \neq j \end{aligned} \quad (5.48)$$

The diagonal and the off-diagonal elements of J_2 are the followings.

$$\begin{aligned} \frac{\partial P_{i,load}^\sigma}{\partial w_{V_i^\sigma}} &= 2\Delta |V_i^\sigma| \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta |V_i^\sigma| \right] |Y_{ii}^{\sigma\sigma}| \cos(\theta_{ii}^{\sigma\sigma}) \\ &\quad + \Delta |V_i^\sigma| \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta |V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \cdot \Delta \delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta \delta_j^{\sigma'} \left. \right) \end{aligned} \quad (5.49)$$

$$\begin{aligned} \frac{\partial P_{i,load}^\sigma}{\partial w_{V_j^{\sigma'}}} &= \Delta |V_j^{\sigma'}| \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta |V_i^\sigma| \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \right. \\ &\quad \cdot \Delta \delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta \delta_j^{\sigma'} \left. \right); \sigma \neq \sigma' \& i \neq j \end{aligned} \quad (5.50)$$

The diagonal and the off-diagonal elements of J_3 are the followings.

$$\begin{aligned} \frac{\partial Q_{i,load}^\sigma}{\partial w_{\delta_i^\sigma}} &= \Delta \delta_i^\sigma \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta |V_i^\sigma| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta |V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \cdot \Delta \delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta \delta_j^{\sigma'} \left. \right) \end{aligned} \quad (5.51)$$

$$\begin{aligned} \frac{\partial Q_{i,load}^\sigma}{\partial w_{\delta_j^{\sigma'}}} &= -\Delta \delta_j^{\sigma'} \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta |V_i^\sigma| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta |V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \cdot \Delta \delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta \delta_j^{\sigma'} \left. \right); \sigma \neq \sigma' \& i \neq j \end{aligned} \quad (5.52)$$

The diagonal and the off-diagonal elements of J_4 are the followings.

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial w_{V_i^{\sigma}}} &= -2\Delta|V_i^{\sigma}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ii}^{\sigma\sigma}| \sin(\theta_{ii}^{\sigma\sigma}) \\ &\quad - \Delta|V_i^{\sigma}| \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta\delta_j^{\sigma'} \left. \right) \end{aligned} \quad (5.53)$$

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial w_{V_j^{\sigma'}}} &= -\Delta|V_j^{\sigma'}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \right. \\ &\quad \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta\delta_j^{\sigma'} \left. \right); \sigma \neq \sigma' \& i \neq j \end{aligned} \quad (5.54)$$

Substituting equation (5.42) for δ_i^{σ} and δ_j^{σ} in equations (5.16) and (5.17) and substituting equation (5.43) for $|V_i^{\sigma}|$ and $|V_j^{\sigma}|$ in equations (5.16) and (5.17) in the case of having connected single phase PV inverters in the phase A, B or C at any node i :

$$\begin{aligned} P_{i,load}^{\sigma} &= \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta\delta_j^{\sigma'} \left. \right) - P_{i,pv}^{\sigma} \end{aligned} \quad (5.55)$$

$$\begin{aligned} Q_{i,load}^{\sigma} &= - \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta\delta_j^{\sigma'} \left. \right) - Q_{i,pv}^{\sigma} \end{aligned} \quad (5.56)$$

From equations (5.55)-(5.56), it can be transformed to the linear equations as shown in equation (5.46). The diagonal and the off-diagonal elements of J_1 are the followings.

$$\begin{aligned} \frac{\partial P_{i,load}^{\sigma}}{\partial w_{\delta_i^{\sigma}}} &= \Delta\delta_i^{\sigma} \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ &\quad \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ &\quad \cdot \Delta\delta_j^{\sigma'} \left. \right) \end{aligned} \quad (5.57)$$

$$\begin{aligned} \frac{\partial P_{i,load}^{\sigma}}{\partial w_{\delta_j^{\sigma'}}} = & -\Delta\delta_j^{\sigma'} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ & \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ & \left. \cdot \Delta\delta_j^{\sigma'} \right); \sigma \neq \sigma' \text{ \& } i \neq j \end{aligned} \quad (5.58)$$

The diagonal and the off-diagonal elements of J_2 are shown in equations (5.59) and (5.60) respectively where equations (5.61) and (5.62) are the differential equations of continuous and piecewise linear P(U) local control functions respectively.

$$\begin{aligned} \frac{\partial P_{i,load}^{\sigma}}{\partial w_{V_i^{\sigma}}} = & 2\Delta|V_i^{\sigma}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ii}^{\sigma\sigma}| \cos(\theta_{ii}^{\sigma\sigma}) \\ & + \Delta|V_i^{\sigma}| \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \text{ \& } i \neq j} \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ & \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ & \left. \cdot \Delta\delta_j^{\sigma'} \right) - \frac{\partial P_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}} \end{aligned} \quad (5.59)$$

$$\begin{aligned} \frac{\partial P_{i,load}^{\sigma}}{\partial w_{V_j^{\sigma'}}} = & \Delta|V_j^{\sigma'}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \right. \\ & \left. \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta\delta_j^{\sigma'} \right); \sigma \neq \sigma' \text{ \& } i \neq j \end{aligned} \quad (5.60)$$

$$\begin{aligned} \frac{\partial P_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}} = & \frac{-4 \cdot \Delta|V_i^{\sigma}| \cdot P_i^{max} \cdot \exp \left[-4 \left(\left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] - V_{i,crit}^{\sigma} \right) / \delta_{i,p}^{\sigma} \right]}{\delta_{i,p}^{\sigma} \cdot \left[1 + \exp \left[-4 \left(\left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] - V_{i,crit}^{\sigma} \right) / \delta_{i,p}^{\sigma} \right] \right]^2} \end{aligned} \quad (5.61)$$

$$\frac{\partial P_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}} = P_i^{max} \cdot \begin{cases} \frac{\Delta V_i^{\sigma}}{V_{i,p1}^{\sigma} - V_{i,p2}^{\sigma}} ; V_{i,p1}^{\sigma} \leq |V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta V_i^{\sigma} < V_{i,p2}^{\sigma} \\ 0 ; other \end{cases} \quad (5.62)$$

The diagonal and the off-diagonal elements of J_3 are the followings.

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial w_{\delta_i^{\sigma}}} = & \Delta\delta_i^{\sigma} \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \text{ \& } i \neq j} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ & \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ & \left. \cdot \Delta\delta_j^{\sigma'} \right) \end{aligned} \quad (5.63)$$

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial w_{\delta_j^{\sigma'}}} = & -\Delta\delta_j^{\sigma'} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ & \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ & \left. \cdot \Delta\delta_j^{\sigma'} \right); \sigma \neq \sigma' \text{ \& } i \neq j \end{aligned} \quad (5.64)$$

The diagonal and the off-diagonal elements of J_4 are shown in equations (5.65) and (5.66) respectively where equations (5.67) and (5.68) are the differential equations of continuous and piecewise linear Q(U) local control functions respectively.

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial w_{V_i^{\sigma}}} = & -2\Delta|V_i^{\sigma}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ii}^{\sigma\sigma}| \sin(\theta_{ii}^{\sigma\sigma}) \\ & - \Delta|V_i^{\sigma}| \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \text{ \& } i \neq j} \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\ & \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\ & \left. \cdot \Delta\delta_j^{\sigma'} \right) - \frac{\partial Q_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}} \end{aligned} \quad (5.65)$$

$$\begin{aligned} \frac{\partial Q_{i,load}^{\sigma}}{\partial w_{V_j^{\sigma'}}} = & -\Delta|V_j^{\sigma'}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \right. \\ & \left. \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta\delta_j^{\sigma'} \right); \sigma \neq \sigma' \text{ \& } i \neq j \end{aligned} \quad (5.66)$$

$$\begin{aligned} \frac{\partial Q_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}} = & \frac{-4 \cdot K_{i,2}^{\sigma} \cdot \Delta|V_i^{\sigma}| \cdot Q_i^{max} \cdot \exp \left[-4 \left(\left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] - V_{i,q}^{\sigma} \right) / \delta_{i,q}^{\sigma} \right]}{\delta_{i,q}^{\sigma} \cdot \left[1 + \exp \left[-4 \left(\left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] - V_{i,q}^{\sigma} \right) / \delta_{i,q}^{\sigma} \right] \right]^2} \end{aligned} \quad (5.67)$$

$$\frac{\partial Q_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}} = Q_i^{max} \cdot \begin{cases} \frac{\Delta V_i^{\sigma} (K_{i,1}^{\sigma} - V_{i,2}^{\sigma})}{V_{i,q1}^{\sigma} - V_{i,q2}^{\sigma}}; & V_{i,q1}^{\sigma} \leq |V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta V_i^{\sigma} < V_{i,q2}^{\sigma} \\ 0 & ; \text{ other} \end{cases} \quad (5.68)$$

Substituting equation (5.42) for δ_i^{σ} and δ_j^{σ} in equations (5.30) and (5.31) and substituting equation (5.43) for $|V_i^{\sigma}|$ and $|V_j^{\sigma}|$ in equations (5.30) and (5.31) in the case of having connected three phase PV inverters in the phases A, B and C at any node i :

$$P_{i,load}^{\sigma} = \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta |V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \cdot \Delta |V_j^{\sigma'}| \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta \delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta \delta_j^{\sigma'} \right) - P_{i,pv}^{\sigma} \quad (5.69)$$

$$Q_{i,load}^{\sigma} = - \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta |V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \cdot \Delta |V_j^{\sigma'}| \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta \delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta \delta_j^{\sigma'} \right) - Q_{i,pv}^{\sigma} \quad (5.70)$$

From equations (5.69)-(5.70), it can be transformed to the linear equations as shown in equation (5.46). The diagonal and the off-diagonal elements of J_1 can be written into equations (5.71) and (5.72) respectively where $\frac{\partial P_{i,pv}^{\sigma}}{\partial w_{\delta_i^{\sigma}}}$ and $\frac{\partial P_{i,pv}^{\sigma}}{\partial w_{\delta_j^{\sigma'}}$ can be clarified in Appendix B.2.

$$\frac{\partial P_{i,load}^{\sigma}}{\partial w_{\delta_i^{\sigma}}} = \Delta \delta_i^{\sigma} \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta |V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \cdot \Delta |V_j^{\sigma'}| \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta \delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta \delta_j^{\sigma'} \right) - \frac{\partial P_{i,pv}^{\sigma}}{\partial w_{\delta_i^{\sigma}}} \quad (5.71)$$

$$\frac{\partial P_{i,load}^{\sigma}}{\partial w_{\delta_j^{\sigma'}}} = -\Delta \delta_j^{\sigma'} \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta |V_i^{\sigma}| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \cdot \Delta |V_j^{\sigma'}| \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta \delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta \delta_j^{\sigma'} \right) - \frac{\partial P_{i,pv}^{\sigma}}{\partial w_{\delta_j^{\sigma'}}} ; \sigma \neq \sigma' \& i \neq j \quad (5.72)$$

The diagonal and the off-diagonal elements of J_2 can be written in equations (5.73) and (5.74) respectively where $\frac{\partial P_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}}$ and $\frac{\partial P_{i,pv}^{\sigma}}{\partial w_{V_j^{\sigma'}}$ can be clarified in Appendix B.2.

$$\begin{aligned}
\frac{\partial P_{i,load}^\sigma}{\partial w_{V_i^\sigma}} &= 2\Delta|V_i^\sigma| \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta|V_i^\sigma| \right] |Y_{ii}^{\sigma\sigma}| \cos(\theta_{ii}^{\sigma\sigma}) \\
&\quad + \Delta|V_i^\sigma| \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\

&\quad \left. \cdot \Delta\delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta\delta_j^{\sigma'} \right) - \frac{\partial P_{i,pv}^\sigma}{\partial w_{V_j^{\sigma'}}}; \sigma \neq \sigma' \& i \neq j
\end{aligned} \tag{5.74}$$

The diagonal and the off-diagonal elements of J_3 can be written into equation (5.75) and (5.76) respectively where $\frac{\partial Q_{i,pv}^\sigma}{\partial w_{\delta_i^\sigma}}$ and $\frac{\partial Q_{i,pv}^\sigma}{\partial \delta_j^{\sigma'}}$ can be clarified in Appendix B.2.

$$\begin{aligned}
\frac{\partial Q_{i,load}^\sigma}{\partial w_{\delta_i^\sigma}} &= \Delta\delta_i^\sigma \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \& i \neq j} \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta|V_i^\sigma| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\
&\quad \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \cdot \Delta\delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\
&\quad \left. \cdot \Delta\delta_j^{\sigma'} \right)
\end{aligned} \tag{5.75}$$

$$\begin{aligned}
\frac{\partial Q_{i,load}^\sigma}{\partial w_{\delta_j^{\sigma'}}} &= -\Delta\delta_j^{\sigma'} \left[|V_i^\sigma| + w_{V_i^\sigma} \cdot \Delta|V_i^\sigma| \right] \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\
&\quad \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \cos \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^\sigma - w_{\delta_i^\sigma} \cdot \Delta\delta_i^\sigma + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\
&\quad \left. \cdot \Delta\delta_j^{\sigma'} \right) - \frac{\partial Q_{i,pv}^\sigma}{\partial \delta_j^{\sigma'}}; \sigma \neq \sigma' \& i \neq j
\end{aligned} \tag{5.76}$$

The diagonal and the off-diagonal elements of J_4 can be written in equations (5.77) and (5.78) respectively where $\frac{\partial Q_{i,pv}^\sigma}{\partial w_{V_i^\sigma}}$ and $\frac{\partial Q_{i,pv}^\sigma}{\partial w_{V_j^{\sigma'}}$ can be clarified in Appendix B.2.

$$\begin{aligned}
\frac{\partial Q_{i,load}^{\sigma}}{\partial w_{V_i^{\sigma}}} &= -2\Delta|V_i^{\sigma}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ii}^{\sigma\sigma}| \sin(\theta_{ii}^{\sigma\sigma}) \\
&\quad - \Delta|V_i^{\sigma}| \sum_{j=1}^n \sum_{\sigma' \in \{A,B,C\}}^{\sigma \neq \sigma' \text{ \& } i \neq j} \left[|V_j^{\sigma'}| + w_{V_j^{\sigma'}} \right. \\
&\quad \cdot \Delta|V_j^{\sigma'}| \left. \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \right. \\
&\quad \left. \cdot \Delta\delta_j^{\sigma'} \right) - \frac{\partial Q_{i,pv}^{\sigma}}{\partial w_{V_i^{\sigma}}}
\end{aligned} \tag{5.77}$$

$$\begin{aligned}
\frac{\partial Q_{i,load}^{\sigma}}{\partial w_{V_j^{\sigma'}}} &= -\Delta|V_j^{\sigma'}| \left[|V_i^{\sigma}| + w_{V_i^{\sigma}} \cdot \Delta|V_i^{\sigma}| \right] |Y_{ij}^{\sigma\sigma'}| \sin \left(\theta_{ij}^{\sigma\sigma'} - \delta_i^{\sigma} - w_{\delta_i^{\sigma}} \right. \\
&\quad \left. \cdot \Delta\delta_i^{\sigma} + \delta_j^{\sigma'} + w_{\delta_j^{\sigma'}} \cdot \Delta\delta_j^{\sigma'} \right) - \frac{\partial Q_{i,pv}^{\sigma}}{\partial w_{V_j^{\sigma'}}}; \sigma \neq \sigma' \text{ \& } i \neq j
\end{aligned} \tag{5.78}$$

The new estimates for step-change values are:

$$w_{V_i^{\sigma}}^{(h+1)} = w_{V_i^{\sigma}}^{(h)} + \Delta w_{V_i^{\sigma}}^{(h)} \tag{5.79}$$

$$w_{\delta_i^{\sigma}}^{(h+1)} = w_{\delta_i^{\sigma}}^{(h)} + \Delta w_{\delta_i^{\sigma}}^{(h)} \tag{5.80}$$

The procedure for power flow solution by the Newton-Raphson method is as follows. The related flow chart can be shown in Figure 5.1.

STEP 1: For load buses, where $P_i^{\sigma sch}$ and $Q_i^{\sigma sch}$ are specified, voltage magnitudes and phase angles are set equal to the slack bus values.

STEP 2: For step-change values, $w_{V_i^{\sigma}}^{(0)} = w_{\delta_i^{\sigma}}^{(0)} = 1$.

STEP 3: For load buses, $P_i^{\sigma(k)}$ and $Q_i^{\sigma(k)}$ are calculated from equations (5.1), (5.2), (5.16), (5.17), (5.30) and (5.31). $\Delta P_i^{\sigma(k)}$ and $\Delta Q_i^{\sigma(k)}$ are calculated from equations (5.40) and (5.41).

STEP 4: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.8)-(5.15), (5.18)-(5.29) and (5.32)-(5.39).

STEP 5: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k)}$ and $\Delta|V_i^{\sigma(k)}|$ are obtained.

STEP 6: For load buses, $P_i^{\sigma(h)}$ and $Q_i^{\sigma(h)}$ are calculated from equations (5.44), (5.45), (5.55), (5.56), (5.69) and (5.70). $\Delta P_i^{\sigma(h)}$ and $\Delta Q_i^{\sigma(h)}$ are calculated from equations (5.40) and (5.41).

STEP 7: Determine:

$$\max \left\{ \left| \Delta P_i^{\sigma(h)} \right|, \left| \Delta Q_i^{\sigma(h)} \right| \right\} > \max \left\{ \left| \Delta P_i^{\sigma(h-1)} \right|, \left| \Delta Q_i^{\sigma(h-1)} \right| \right\}$$

- If the condition is correct, the new voltage magnitudes and phase angles are computed from equations (5.42) and (5.43) by $w_{V_i^{\sigma}}^{(h-1)}$ and $w_{\delta_i^{\sigma}}^{(h-1)}$. After that, $w_{V_i^{\sigma}}^{(h)} = w_{\delta_i^{\sigma}}^{(h)}$ are renewed that the value are accordingly reduced from $\{0.9, 0.8, \dots, 0.1\}$. Finally, go to **STEP 3**.
- If the condition is vice versa, go to **STEP 8**.
- If $\max \left\{ \left| \Delta P_i^{\sigma(h)} \right|, \left| \Delta Q_i^{\sigma(h)} \right| \right\} < \varepsilon$, the power flow algorithm is terminated and the new voltage magnitudes and phase angles are computed from equations (5.42) and (5.43) by $w_{V_i^{\sigma}}^{(h)}$ and $w_{\delta_i^{\sigma}}^{(h)}$.

STEP 8: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

STEP 9: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h)}$ are obtained.

STEP 10: The new step-length values are computed from equations (5.79) and (5.80). After that, go to **STEP 6**.

For example, the calculation of *The Power Flow Algorithm With Using Local Control Function* can be shown in Appendix C.

Figure 5.1 The flowchart of power flow algorithm with using local control function

5.2 2-stage PSO Process

This research determines the set of uncertainty in 17 cases as shown in Table 4.3 which is stated in Subsection 4.4.2.2 to cover uncertainty characteristics of load, solar irradiance and ambient temperature in one day or one week interval. Considering the benefit of PV owner, the main objective can be shown in equation (5.81) that total

real power output from overall connected PV system must be injected to LV distribution system at maximum value. The main objective (5.81) determines on the case $z1$ of the set of uncertainty as the representative condition because this case has the highest chance to occur according to normal uncertainty characteristic.

$$\text{maximize} \left[\sum_i^n \sum_{\sigma \in \{A,B,C\}} P_{i,pv,z1}^\sigma \right] \quad (5.81)$$

Subject to:

$$V_{min}^\sigma \leq V_{i,z}^\sigma \leq V_{max}^\sigma \quad (5.82)$$

$$|I_{i-j,z}^\sigma| \leq I_{i-j,max}^\sigma \quad (5.83)$$

$$|S_z^{MV/LV}| \leq S_{max}^{MV/LV} \quad (5.84)$$

$$VUF_{i,z} \leq 3\% ; VUF_i = \frac{|V_i^{ne}|}{|V_i^{po}|} \times 100\% \quad (5.85)$$

$$P_{loss,z} \leq LOSS_{max\ load, no\ PV} \quad (5.86)$$

where $z \in \{z1, z2, \dots, z17\}$; $P_{i,pv}^\sigma$ is real power output from each phase connection of PV system (W); V_{min}^σ and V_{max}^σ are minimum and maximum voltage limit (V) respectively; I_{i-j}^σ is line current at any phase σ between nodes i and j (A); $I_{i-j,max}^\sigma$ is maximum line current limit at any phase σ between nodes i and j (A); $S^{MV/LV}$ is the utilization capacity of distribution transformer (VA); $S_{max}^{MV/LV}$ is the capacity limit of distribution transformer (VA); P_{loss} is system loss (W); $LOSS_{max\ load, no\ PV}$ is maximum loss in LV distribution system with no PV connection at maximum load (W).

Although objective function (5.81) determines only case $z1$, the constraints need to consider in overall 17 cases to qualify the correct solution under the uncertainty as shown in equations (5.82)-(5.86). At equation (5.82), voltage will not exceed voltage limit. Line current in equation (5.83) and the utilization capacity of distribution transformer in equation (5.84) will not exceed the limit. IEC 61000-2-2 standard defines that VUF limit in LV distribution system shall not exceed 3% in equation (5.81). At the view point of Distribution System Operator (DSO), high PV penetration can be permitted but PV connection must not cause higher loss than LV distribution system with no PV connection. Then, the constraint (5.86) is presented.

According to the optimization problem in equation (5.81), some readers may doubt that can this optimization problem determines on only severe case or case z16 (this case is considered on minimum load and maximum solar irradiance condition). Then, this question of doubt will be clarified in Appendix D. For the past proposal of this research, it presented the main objective as shown in equation (5.87) which maximizing the summation values along the total real power output from overall PV systems and the negative value of system loss. This concept is for maximizing the total real power output from overall PV systems as shown in equation (5.88) and minimizing system loss as shown in equation (5.89). The minimization of system loss equals the maximization of minus system loss as shown in equation (5.90).

$$\text{maximize} \left[\sum_i^n \sum_{\sigma \in \{A,B,C\}} P_{i,pv,z1}^\sigma \right] - P_{loss,z1} \quad (5.87)$$

$$\text{maximize} \left[\sum_i^n \sum_{\sigma \in \{A,B,C\}} P_{i,pv,z1}^\sigma \right] \quad (5.88)$$

$$\text{minimize} [P_{loss,z1}] \quad (5.89)$$

$$\text{maximize} [-P_{loss,z1}] \quad (5.90)$$

The summation of equation (5.88) and (5.89) is the equation (5.87). This past objective (5.87) seemed to solve maximization of total real power output from overall PV systems and minimization of system loss simultaneously. Thus, this past objective (5.87) was incorrect because the objective (5.88) of maximizing total real power output from overall PV systems is conflict with the other objective (5.89) of minimizing system loss. This conflict problem can be described in Appendix E.

To solve the optimization problem, there are many researches [42, 43] which apply PSO because PSO can solve optimization problem effectively. To solve the optimization problem as shown in equation (5.81), this research will apply PSO. Searching the optimal solution by PSO, the result will be at the optimal objective value. For objective value assessment according to the objective (5.81), there are 6 steps as follows and the related flow chart can be shown in Figure 5.2.

STEP 1: Define parameter setting of local control of each connected PV system $\{V_{i,cri}, \delta_{i,p}, K_{i,1}, K_{i,2}, V_{i,q}, \delta_{i,q}\}$ or $\{V_{i,p1}, V_{i,p2}, K_{i,1}, K_{i,2}, V_{i,q1}, V_{i,q2}\}$ according to selected type: continuous or piecewise linear local control function.

STEP 2: For each iteration, each member of the set of uncertainty will be selected $z \in \{z1, z2, \dots, z17\}$ until all members of z are selected. Each member will give the different values of load, solar irradiance and ambient temperature.

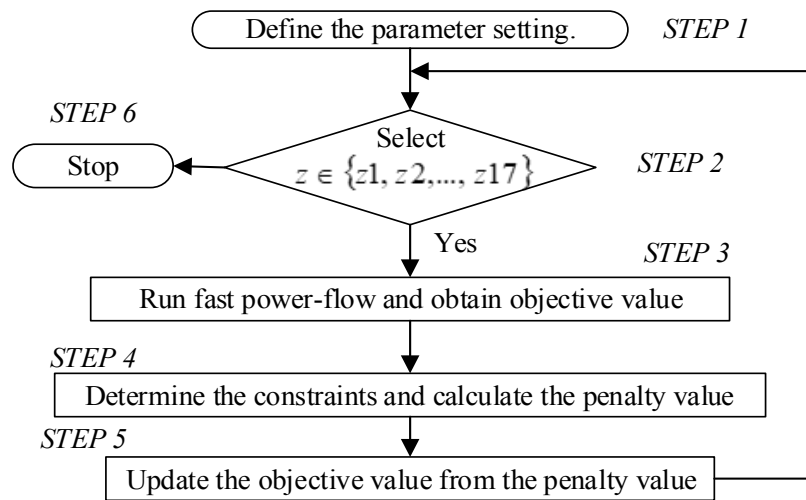

Figure 5.2 The flowchart of the calculation of objective value

STEP 3: From obtained load, solar irradiance and ambient temperature values in the previous step, they will be used in *The Power Flow Algorithm with Using Local Control Function* as stated in Subsection 5.1. After that, the results of real and reactive power output from each PV systems, system voltage, system loss, line flow and utilized capacity of MV/LV distribution transformer are obtained. This step objective value (*Obj*) can be calculated from equation (5.81) if only case $z1$ is selected.

STEP 4: For each selected case $z \in \{z1, z2, \dots, z17\}$, the results from the previous step will be compared to the constraints (5.82)-(5.86) that the equation (5.87) is presented to indicate the constraints qualification. The value $penalty_z$ will be zero if the results from the previous step are within the constraints limit or the value $penalty_z$ will be more than zero if they are vice versa.

$$\begin{aligned}
penalty_z = & K_{p1} \cdot \max(0, V_{min}^\sigma - V_{i,z}^\sigma, V_{i,z}^\sigma - V_{max}^\sigma) + \\
& K_{p2} \cdot \max(0, |I_{i-j,z}^\sigma| - I_{i-j,max}^\sigma) + \\
& K_{p3} \cdot \max(0, |S_z^{MV/LV}| - S_{max}^{MV/LV}) + \\
& K_{p4} \cdot \max(0, VUF_{i,z} - 3) \\
& K_{p5} \cdot \max(0, P_{loss,z} - Loss_{max\ load, no\ PV})
\end{aligned} \tag{5.87}$$

where K_{p1} , K_{p2} , K_{p3} , K_{p4} and K_{p5} are constant values.

STEP 5: Update objective value (Obj), from the value $penalty_z$ which obtains from the previous step, as shown in equation (5.83) after that go to **STEP 2**.

$$Obj = Obj - penalty_z \tag{5.83}$$

STEP 6: If all members of z in **STEP 2** are selected, the iteration terminates and the objective value (Obj), which depends on the parameter setting, is obtained.

PSO optimization does not fit for finding optimal solution from many free variables. Then, this research divides PSO process into two stages. The flow chart of two-stages PSO can be shown in Figure 5.3 and the flow chart of each stage PSO can be shown in Figure 5.4.

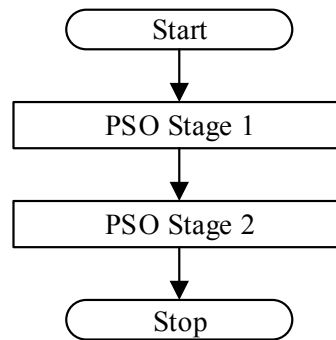

Figure 5.3 The flowchart of 2-stage PSO

1st-STAGE PSO: Define the same parameter adjustment as shown in Tables (5.1) and (5.2) for continuous and piecewise linear local control function. Then, this stage has 6 free variables to find optimal solution.

Table 5.1 The parameters setting of continuous local control function

| PV | Local Control | | | | | |
|-------------------|---------------|------------|---------------|-------|-------|------------|
| | P(U) Function | | Q(U) Function | | | |
| 1 st | V_{cri} | δ_p | K_1 | K_2 | V_q | δ_q |
| 2 nd | V_{cri} | δ_p | K_1 | K_2 | V_q | δ_q |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |
| i th | V_{cri} | δ_p | K_1 | K_2 | V_q | δ_q |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |
| npv th | V_{cri} | δ_p | K_1 | K_2 | V_q | δ_q |

Table 5.2 The parameters setting of piecewise linear local control function

| PV | Local Control | | | | | |
|-------------------|---------------|----------|---------------|-------|----------|----------|
| | P(U) Function | | Q(U) Function | | | |
| 1 st | V_{p1} | V_{p2} | K_1 | K_2 | V_{q1} | V_{q2} |
| 2 nd | V_{p1} | V_{p2} | K_1 | K_2 | V_{q1} | V_{q2} |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |
| i th | V_{p1} | V_{p2} | K_1 | K_2 | V_{q1} | V_{q2} |
| ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ | ⋮ |
| npv th | V_{p1} | V_{p2} | K_1 | K_2 | V_{q1} | V_{q2} |

2nd-STAGE PSO: This state uses optimal solution from **1st-STATE PSO** as initial point. However, the parameter setting of each PV system is not the same or there are $npv \times 6$ free variables if there are npv PV systems. After finishing **2nd-STAGE PSO**, the optimal parameter setting of each connected PV system will be obtained.

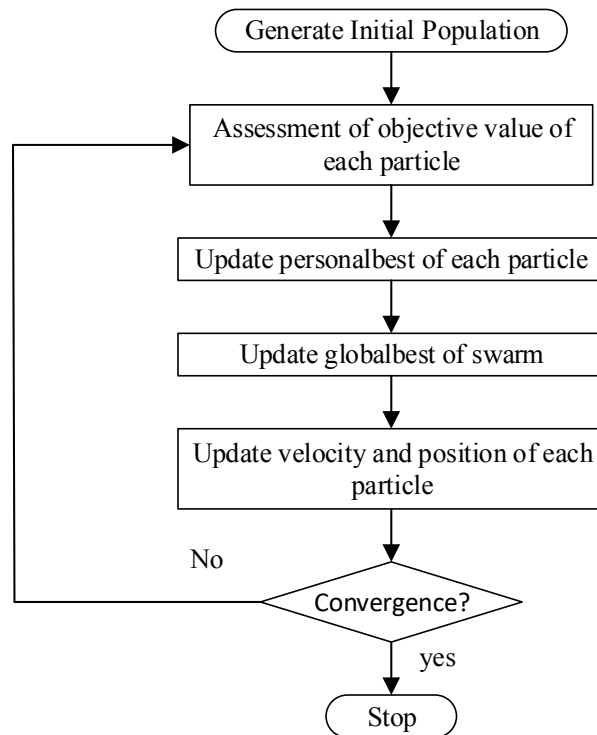

Figure 5.4 The flowchart of each stage PSO

CHAPTER 6

DETAILS OF TEST SYSTEMS

This chapter will address about 2 test systems that are used in this research. The first is a modified 19 node LV distribution system and the second is a modified 29 node LV distribution system. Moreover, load, solar irradiance and ambient temperature data are presented too.

6.1 The Modified 19 Node LV Distribution System

This modified 19 node distribution system [44] as shown in Figure 6.1 is demonstrated in this research and the test system details is composed of:

Figure 6.1 The modified 19 node distribution system

- Base voltage is 230 volts, line to neutral.
- Rated transformer is 125 kVA.
- Voltage limit between 0.9-1.1 pu. is complied with the guideline [31].
- Line spacing between phase conductors is 20 cm.
- Utilizing polyethylene insulated weatherproof aluminum conductors and the parameter can be shown in Table 4.5.
- Two types of wiring conductor is applied. Type 1 (represent in Figure 6.1 as “A1”) uses conductor size as 70, 70, 70 and 35 mm² for phases A, B, C and neutral respectively. Type 2 (represent in Figure 6.1 as “A2”) uses

conductor size as 35, 35, 35 and 35 mm² for phases A, B, C and neutral respectively. The impedance matrix of each type can be shown in Table 6.1.

Table 6.1 The impedance matrix of two type wiring conductors

| Type | Impedance (Ω/km) | | | |
|------|----------------------------------|----------------|----------------|----------------|
| | Phase | A | B | C |
| A1 | A | 0.5213+j0.5550 | 0.1721+j0.3204 | 0.1647+j0.2871 |
| | B | 0.1721+j0.3204 | 0.4970+j0.5887 | 0.1538+j0.3461 |
| | C | 0.1647+j0.2871 | 0.1538+j0.3461 | 0.4838+j0.6071 |
| A2 | A | 0.8439+j0.5765 | 0.1721+j0.3204 | 0.1647+j0.2871 |
| | B | 0.1721+j0.3204 | 0.8196+j0.6102 | 0.1538+j0.3461 |
| | C | 0.1647+j0.2871 | 0.1538+j0.3461 | 0.8064+j0.6287 |

- Utilizing polyethylene insulated weatherproof aluminum conductors and the parameter can be shown in Table 4.5.
- Maximum load at each phase of each node can be shown in Table 6.2.

Table 6.2 Maximum load at each phase of each node

| Node | Maximum Load | | | | | |
|------|--------------|---------|---------|---------|---------|---------|
| | Phase A | | Phase B | | Phase C | |
| | P (W) | Q (VAr) | P (W) | Q (VAr) | P (W) | Q (VAr) |

In this modified 19 node distribution system, the voltage profile result can be shown in Figure 6.2 when there is no PV connection and the simulation is tested on maximum load (1 pu.). The result of loss ($Loss_{max\ load, no\ PV}$) is 6,547.58 W.

Figure 6.2 The voltage profile result

In this modified 19 node distribution system, the study of the maximum high PV penetration under no local control is addressed in Appendix F.

6.2 The Modified 29 Node LV Distribution System

This modified 29 node distribution system [46] as shown in Figure 6.2 is demonstrated in this research and the test system details is composed of:

Figure 6.3 The modified 29 node distribution system

- Base voltage is 230 volts, line to neutral.
- Rated transformer is 125 kVA.
- Voltage limit between 0.9-1.1 pu. is complied with the guideline [31].
- Line spacing between phase conductors is 20 cm.
- Utilizing polyethylene insulated weatherproof aluminum conductors and the parameter can be shown in Table 4.5.
- Two types of wiring conductor is applied. Type 1 (represent in Figure 6.1 as “A1”) uses conductor size as 70, 70, 70 and 35 mm² for phases A, B, C and neutral respectively. Type 2 (represent in Figure 6.1 as “A2”) uses conductor size as 35, 35, 35 and 35 mm² for phases A, B, C and neutral respectively. The impedance matrix of each type can be shown in Table 6.1.
- Maximum load at each phase of each node can be shown in Table 6.5.

Table 6.5 Maximum load at each phase of each node

| PV7 | 9 | 1-phase | C | 4,200 | 2,100 | 25 |
| PV8 | 10 | 3-phase | A,B,C | 10,000 | 5,000 | 58 |
| PV9 | 14 | 3-phase | A,B,C | 7,500 | 3,750 | 39 |
| PV10 | 16 | 3-phase | A,B,C | 10,000 | 5,000 | 58 |
| PV11 | 17 | 1-phase | A | 4,200 | 2,100 | 25 |
| PV12 | 17 | 1-phase | B | 4,200 | 2,100 | 25 |
| PV13 | 17 | 1-phase | C | 4,200 | 2,100 | 25 |
| PV14 | 18 | 1-phase | C | 2,000 | 1,000 | 12 |
| PV15 | 19 | 1-phase | C | 2,000 | 1,000 | 12 |
| PV16 | 21 | 3-phase | A,B,C | 7,500 | 3,750 | 39 |
| PV17 | 23 | 3-phase | A,B,C | 7,500 | 3,750 | 39 |
| PV18 | 24 | 3-phase | A,B,C | 10,000 | 5,000 | 58 |
| PV19 | 25 | 1-phase | A | 2,000 | 1,000 | 12 |
| PV20 | 25 | 1-phase | C | 2,000 | 1,000 | 12 |
| PV21 | 26 | 1-phase | B | 4,200 | 2,100 | 25 |
| PV22 | 27 | 3-phase | A,B,C | 10,000 | 5,000 | 58 |
| PV23 | 28 | 1-phase | A | 2,000 | 1,000 | 12 |
| PV24 | 29 | 1-phase | C | 2,000 | 1,000 | 12 |

In this modified 29 node distribution system, the voltage profile result can be shown in Figure 6.4 when there is no PV connection and the simulation is tested on maximum load (1 pu.). The result of loss ($Loss_{max\ load, no\ PV}$) is 7,642.05 W.

Figure 6.4 The voltage profile result

In this modified 29 node distribution system, the study of the maximum high PV penetration under no local control is addressed in Appendix F.

6.3 Load, Solar Irradiance and Ambient Temperature Data

In this research, the uncertainty analysis unit assumingly uses the collected data at the week 3-9 November 2014 for uncertainty characteristic determination. load, solar irradiance and ambient temperature data every 5 minutes between sun rise period or 6.00-18.00 o'clock along 3-9 November 2014 can be shown in Appendix G or in Figure 6.5 as graph.

(a) Load phase A

(b) Load phase B

(c) Load phase C

(d) Solar irradiance

(e) Ambient temperature

Figure 6.5 The collected data in 3-9 November 2014 between 6.00-18.00 o'clock

6.3.1 Uncertainty Determination at the Week 3-9 November 2014

According to the collected data in Figure 6.5 at the week 3-9 November 2014, the normal uncertainty characteristics of load, solar irradiance and ambient temperature are formed as shown in Figure 6.6.

Figure 6.6 The normal uncertainty characteristics

According to the uncertainty characteristics in Figure 6.6, the result of the set of uncertainty can be shown in Table 6.7. The minimum solar irradiance will be determined at 0.05 kW/m² according to the initial operation of PV inverter [20].

Table 6.7 Set of uncertainty

| Case | Load (pu.) | | | MPP of connected PV system | |
|------|------------|----------|----------|----------------------------|------------------|

6.3.2 Uncertainty Determination at the Day 3 November 2014

According to the collected data in Figure 6.5 at the day 3 November 2014, the normal uncertainty characteristics of load, solar irradiance and ambient temperature are formed as shown in Figure 6.7.

(a) Load phase A

(b) Load phase B

(c) Load phase C

(d) Solar irradiance

(e) Ambient temperature

Figure 6.7 The normal uncertainty characteristics

According to the uncertainty characteristics in Figure 6.7, the result of the set of uncertainty can be shown in Table 6.8. The minimum solar irradiance will be determined at 0.05 kW/m^2 according to the initial operation of PV inverter [20].

Table 6.8 Set of uncertainty

6.3.3 Uncertainty Determination at the Day 4 November 2014

According to the collected data in Figure 6.5 at the day 4 November 2014, the normal uncertainty characteristics of load, solar irradiance and ambient temperature are formed as shown in Figure 6.8.

Figure 6.8 The normal uncertainty characteristics

According to the uncertainty characteristics in Figure 6.8, the result of the set of uncertainty can be shown in Table 6.9. The minimum solar irradiance will be determined at 0.05 kW/m² according to the initial operation of PV inverter [20].

Table 6.9 Set of uncertainty

| Case | Load (pu.) | | | MPP of connected PV system | |

6.3.4 Uncertainty Determination at the Day 5 November 2014

According to the collected data in Figure 6.5 at the day 5 November 2014, the normal uncertainty characteristics of load, solar irradiance and ambient temperature are formed as shown in Figure 6.9.

Figure 6.9 The normal uncertainty characteristics

According to the uncertainty characteristics in Figure 6.9, the result of the set of uncertainty can be shown in Table 6.10. The minimum solar irradiance will be determined at 0.05 kW/m² according to the initial operation of PV inverter [20].

Table 6.10 Set of uncertainty

| Case | Load (pu.) | | | MPP of connected PV system | |

6.3.5 Uncertainty Determination at the Day 6 November 2014

According to the collected data in Figure 6.5 at the day 6 November 2014, the normal uncertainty characteristics of load, solar irradiance and ambient temperature are formed as shown in Figure 6.10.

(a) Load phase A

(b) Load phase B

(c) Load phase C

(d) Solar irradiance

(e) Ambient temperature

Figure 6.10 The normal uncertainty characteristics

According to the uncertainty characteristics in Figure 6.10, the result of the set of uncertainty can be shown in Table 6.11. The minimum solar irradiance will be determined at 0.05 kW/m^2 according to the initial operation of PV inverter [20].

Table 6.11 Set of uncertainty

| Case | Load (pu.) | | | MPP of connected PV system | |

6.3.8 Uncertainty Determination at the Day 9 November 2014

According to the collected data in Figure 6.5 at the day 9 November 2014, the normal uncertainty characteristics of load, solar irradiance and ambient temperature are formed as shown in Figure 6.13.

(e) Ambient temperature

Figure 6.13 The normal uncertainty characteristics

According to the uncertainty characteristics in Figure 6.13, the result of the set of uncertainty can be shown in Table 6.14. The minimum solar irradiance will be determined at 0.05 kW/m² according to the initial operation of PV inverter [20].

Table 6.14 Set of uncertainty

| Case | Load (pu.) | | | MPP of connected PV system | |

CHAPTER 7

SIMULATION RESULTS AND DISCUSSION

In this chapter, 2 different LV distribution systems will be demonstrated, i.e. modified 19 and 29 node LV distribution systems. The uncertainty characteristic prediction is assumed to come from at the week 3-9 November 2014. To show the effectiveness of the coordination between central and local control, the simulation results are divided into seven subsections: (7.1) P(U) and Q(U) local control application; (7.2) The same and different parameters setting of local control; (7.3) The continuous and piecewise linear local control application; (7.4) local control adjustment in every one week or one day of continuous local control function; (7.5) local control adjustment in every one week or one day of piecewise linear local control function; (7.6) local control adjustment in the modified 29 node LV distribution system; Monte Carlo simulations.

7.1 P(U) and Q(U) Local Control Application

In this subsection, the comparison between (7.1.1) no local control, (7.1.2) the only P(U) application and (7.1.3) both P(U) and Q(U) application to show the effectiveness of both P(U) and Q(U) application in real power generation enhancement in to LV distribution system. The continuous local control function is selected in this subsection.

7.1.1 No Local Control

In the past, there are many researches, such as [4], that the operation of PV system is considered as unity power factor. According to the set of uncertainty at the week 3-9 November 2014 in Table 6.7, the power flow results can be shown in Figure 7.1 when PV system operates on unity power factor. It can notice that overvoltage and over loss (at 6,547.58 W) is occurred in LV distribution system with high PV penetration.

(a) Minimum and maximum phase voltage

(b) Maximum VUF

(c) MV/LV transformer utilization

(d) Maximum line capacity

(e) System loss

(f) Total real power output from PV systems

Figure 7.1 The results of the set of uncertainty

where the minimum voltage is determined from any phase and node according to system voltage result that has the lowest value. The maximum voltage is vice versa. Maximum VUF is determined from any node according to system VUF result that has the highest value. Maximum line capacity is determined from any line of each phase that has the maximum value of $\frac{\text{Line Current}}{\text{Line Capacity}} \times 100\%$.

7.1.2 The only P(U) Application

The research [12] considers only local control P(U) function of PV system. The result is that PV system can generate less real power into LV distribution system because only real power output will be limited when voltage at the connection of PV system is increased. According to the set of uncertainty at the week 3-9 November 2014 in Table 6.7, the result of the parameters setting of P(U) function can be shown in Table 7.1. The optimal objective value in equation (5.81) is 33,197.32 W. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the results of minimum and maximum voltage profile, maximum VUF, MV/LV transformer utilization, maximum line capacity and total real power output from PV systems can be shown in Figure 7.2.

Table 7.1 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |

195938377

Figure 7.2 The results of the set of uncertainty

The results according to Figure 7.2 are within the limit. The total real power output from PV systems at maximum value is 84,581.02 W at the case z2. It is because the case z2 has maximum phase A, B and C loads and, therefore, each connected PV system can generate a lot of real power output to the LV distribution system before each connected PV system is limited by real power output by the P(U) function.

7.1.3 Both P(U) and Q(U) Application

In this subsection, the connected PV system will operate on local control on real power adjustment local control as stated in equations (4.3) or (4.4) and reactive power adjustment as stated in equations (4.6) or (4.7). The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the week 3-9 November 2014 in Table 6.7, the optimal objective value in equation (5.81) is 42,643.37 W and the results of optimal parameter setting can be shown in Table 7.2. Considering only the case $z \in \{z1, z2, \dots, z17\}$, the results of minimum and maximum voltage profile, maximum VUF, MV/LV transformer utilization, maximum line capacity and total real power output from PV systems can be shown in Figure 7.3.

Table 7.2 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |
|---------|-------------------|------------|-------|-------|-------|------------|
| | V_{crit} | δ_p | K_1 | K_2 | V_q | δ_q |
| PV1 | 1.094 | 0.023 | 0.348 | 0.605 | 1 | 0.017 |
| PV2 | 1.098 | 0.011 | 0.304 | 0.881 | 1.001 | 0.017 |

| PV6 | 1.126 | 0.014 | 0.469 | 0.925 | 1.011 | 0.068 |
| PV7 | 1.137 | 0.028 | 0.597 | 1.145 | 1.007 | 0.048 |
| PV8 | 1.101 | 0.021 | 0.303 | 0.935 | 1.009 | 0.073 |
| PV9 | 1.082 | 0.013 | 0.235 | 1.161 | 1.015 | 0.08 |
| PV10 | 1.08 | 0.01 | 0.85 | 0.963 | 1.005 | 0.077 |
| PV11 | 1.104 | 0.016 | 0.302 | 0.93 | 1.015 | 0.08 |
| PV12 | 1.071 | 0.031 | 0.228 | 1.028 | 1.006 | 0.06 |
| PV13 | 1.123 | 0.01 | 0.417 | 1.089 | 1.011 | 0.063 |
| PV14 | 1.067 | 0.022 | 0.256 | 0.827 | 1.007 | 0.072 |
| PV15 | 1.076 | 0.015 | 0.24 | 1.018 | 1.009 | 0.075 |
| PV16 | 1.088 | 0.01 | 0.315 | 0.901 | 1.009 | 0.083 |
| PV17 | 1.079 | 0.014 | 0.754 | 1 | 1.006 | 0.081 |
| PV18 | 1.071 | 0.035 | 0.426 | 0.959 | 1.012 | 0.078 |

Figure 7.3 The results of the set of uncertainty

The results according to Figure 7.1 are within the limit. The total real power output from PV systems at maximum value is 103,937.38 W at the case z2. It is because the case z2 has maximum phase A, B and C loads and, therefore, each connected PV system can generate a lot of real power output to LV distribution system before each connected PV system is limited by real power output by P(U) function. Comparing between Subsection 7.1.2 and 7.1.3, the percent difference of objective value and

maximum total real power output can be shown in Table 7.3 and it can notice that both P(U) and Q(U) application in Subsection 7.1.3 can apparently generate more real power output into LV distribution system. It is because Q(U) function helps voltage rise support when many PV systems generate real power output into LV distribution system. However, P(U) function also operates to limit real power output for voltage rise support if the operation of Q(U) function is unable to support voltage rise adequately.

Table 7.3 The comparison between only P(U) function and both P(U) and Q(U) functions application

| | Only P(U) Function | Both P(U) and Q(U) Functions | Percent Change of Both P(U) and Q(U) Functions |
|--|-------------------------------|---|---|
| Objective Value | 33,197.32 | 42,643.37 | +28.45% |
| Maximum total real power output | 84,373.67 | 103,937.38 | +23.19% |

The comparison of P(U) and Q(U) function of each PV connection from Table 7.2 can be shown as follows.

- Figure 7.4 shows the comparison of PV1-PV3 where PV1 is at phase-A node 5; PV2 is at phase-B node 5; PV3 is at phase-C node 5.
- Figure 7.5 shows the comparison of PV4-PV6 where PV4 is at 3-phase node 6; PV2 is at 3-phase node 7; PV3 is at 3-phase node 8.
- Figure 7.6 shows the comparison of PV7, PV8 and PV12 where PV7 is at 3-phase node 10; PV8 is at 3-phase node 11; PV12 is at 3-phase node 13.
- Figure 7.7 shows the comparison of PV9-PV11 where PV9 is at phase-A node 12; PV10 is at phase-B node 12; PV3 is at phase-C node 12.
- Figure 7.8 shows the comparison of PV13, PV14 and PV18 where PV13 is at 3-phase node 15; PV14 is at 3-phase node 16; PV18 is at 3-phase node 19.
- Figure 7.9 shows the comparison of PV15-PV17 where PV15 is at phase-A node 18; PV16 is at phase-B node 18; PV17 is at phase-C node 18.

(a) $P(U)$ function

(b) $Q(U)$ function

Figure 7.4 The comparison of PV1-PV3

From Figure 7.4, phase A, B and C loads at the upstream node 5 are not different so much. Then, characteristics of local control are nearly similar.

(a) $P(U)$ function

(b) $Q(U)$ function

Figure 7.5 The comparison of PV4-PV6

From Figure 7.5, PV6 has no limitation from $P(U)$ function because this connection point has more load than node 6 at the connection point of PV4 although PV4 and PV6 are close together according to the data in Table 6.2. PV5 is far from transformer around 1.3 km that PV5 connection at node 7 is farther than PV4 (300 m. long) and PV6 (400 m. long) connections. Then, $P(U)$ function of PV5 is more limited than PV4 and PV6. Accordingly, PV5 is set $Q(U)$ function to absorb more reactive power than the others to be capable of more real power injection.

(a) $P(U)$ function

(b) $Q(U)$ function

Figure 7.6 The comparison of PV7, PV8 and PV12

From Figure 7.6, PV7 is near distribution transformer (600 m. long) than the others. Then, $P(U)_{PV7}$ function is set to inject real power more than $P(U)_{PV8}$ function (700 m. long) and $P(U)_{PV12}$ (1.2 km. long). For $Q(U)$ function, the characteristics of PV7, PV8 and PV12 are close.

(a) $P(U)$ function

(b) $Q(U)$ function

Figure 7.7 The comparison of PV9, PV10 and PV11

PV9-PV11 connect at the same node but in a different phase. Loads of each phase A, B and C are close according to the data in Table 6.2. From Figure 7.7, The characteristics of both $P(U)$ and $Q(U)$ functions of PV9, PV10 and PV11 are different apparently. Probably, it is because of voltage unbalance effect. If PV10 and PV11 are set to inject more real power, any phase of other nodes may be affected in overvoltage problem.

(a) $P(U)$ function

(b) $Q(U)$ function

Figure 7.8 The comparison of PV13, PV14 and PV18

From Figure 7.8, PV13 is nearer distribution transformer (800 m. long) than the others. Then, $P(U)_{PV13}$ function is set to inject real power more than $P(U)_{PV14}$ function (1.2 km. long) and $P(U)_{PV18}$ function (900 m. long). For $Q(U)$ function, the characteristics of PV13, PV14 and PV18 are close.

(a) $P(U)$ function

(b) $Q(U)$ function

Figure 7.9 The comparison of PV15, PV16 and PV17

From Figure 7.9, it can notice that the characteristics of $P(U)$ function of PV15, PV16 and PV17 are limited real power output more than $P(U)$ function from PV1-PV3 connections at upstream node. It is due to the ability to inject more real power output at the upstream node than the downstream node. For $Q(U)$ functions of PV15, PV16

and PV17, they are different apparently. Probably, it is because of voltage unbalance effect.

7.2 The Same and Different Parameters Setting of Local Control

According to Subsection 7.1.3, the parameters setting result of each PV system from 2-stage PSO is determined as different setting. However, the same parameters setting result of each PV system will be obtained at the first stage of 2-stage PSO. According to the set of uncertainty at the week 3-9 November 2014 in Table 6.7, the optimal objective value in equation (5.77) is 40,654.36 W when the first stage of 2-stage PSO is terminated. The same parameters setting result $\{V_{i,cri}, \delta_{i,p}, K_{i,1}, K_{i,2}, V_{i,q}, \delta_{i,q}\}$ is $\{1.066, 0.013, 0.237, 0.882, 1.006, 0.055\}$. Considering only the case $z \in \{z1, z2, \dots, z17\}$, the power flow results can be shown in Figure 7.10. The total real power output from PV systems at maximum value is 97,589.40 W at the case z2. Comparing between this subsection and Subsection 7.1.3, the percent different of objective value and maximum total real power output can be shown in Table 7.4 and it can notice that the different parameters setting at Subsection 7.1.3 is better because the optimal objective value result is higher and the maximum total real power output from PV systems at the case z2 is higher.

Table 7.4 The comparison between the same and different setting of $P(U)$ and $Q(U)$ functions

| | The Same Setting | The Different Setting | Percent Change of The Different Setting |
|--|------------------|-----------------------|---|
| Objective Value | 40,654.36 | 42,643.37 | +4.89% |
| Maximum total real power output | 97,589.40 | 103,937.38 | +6.50% |

Figure 7.10 The results of the set of uncertainty

7.3 The Continuous And Piecewise Linear Local Control Application

In this subsection, the piecewise linear local control function as written in equations (4.8), (4.9), (4.11) and (4.12) will be applied. The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the week 3-9 November 2014 in Table 6.7, the optimal objective value in equation (5.81) is 41,815.83 W and the results of optimal parameter setting can be

shown in Table 7.5. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.3. The power flow results can be shown in Figure 7.11. The total real power output from PV systems at maximum value is 102,518.32 W at the case z_2 . Comparing between this subsection and Subsection 7.1.3, the percent different of objective value and maximum total real power output can be shown in Table 7.6 and it can notice that the results between this subsection and Subsection 7.1.3 are close. Then, local control application can be chosen any one from continuous or piecewise linear function because of the nearly similar results.

Table 7.5 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |
|---------|-------------------|----------|-------|--------|----------|----------|

7.4 Local Control Adjustment in Every One Week or One Day Of Continuous Local Control Function

In this subsection, the comparison between (7.4.1) adjustment per one week and (7.4.2) adjustment per one day is determined for the suitable operation of coordination between central and local control. The continuous local control function is selected in this subsection.

7.4.1 Adjustment Per One Week

In this subsection, the parameters setting in Table 7.2 is applied. The simulations are divided into 7 parts: (7.4.1.1) at the day 3 November 2014; (7.4.1.2) at the day 4 November 2014; (7.4.1.3) at the day 5 November 2014; (7.4.1.4) at the day 6 November 2014; (7.4.1.5) at the day 7 November 2014; (7.4.1.6) at the day 8 November 2014; (7.4.1.7) at the day 9 November 2014. The objective of this subsection is to determine the simulation results when (1) the set of uncertainty of each day is applied and (2) the parameters setting in Table 7.2 at the week 3-9 November 2014 is applied.

7.4.1.1 At The Day 3 November 2014

According to the set of uncertainty at the day 3 November 2014 in Table 6.8, the calculated objective value in equation (5.81) is 49,472.20 W. Considering the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.12 and they are within the limit. The total real power output from PV systems at maximum value is 95,251.06 W at the case z2.

(e) System loss

(f) Total real power output from PV systems

Figure 7.12 The results of the set of uncertainty

7.4.1.2 At The Day 4 November 2014

According to the set of uncertainty at the day 4 November 2014 in Table 6.9, the calculated objective value in equation (5.81) is 44,940.84 W. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.13 and they are within the limit. The total real power output from PV systems at maximum value is 101,056.21 W at the case z2.

(a) Minimum and maximum phase voltage

(b) Maximum VUF

(c) MV/LV transformer utilization

(d) Maximum line capacity

(e) System loss

(f) Total real power output from PV systems

Figure 7.13 The results of the set of uncertainty

7.4.1.3 At The Day 5 November 2014

According to the set of uncertainty at the day 5 November 2014 in Table 6.10, the calculated objective value in equation (5.81) is 41,080.51 W. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.14 and they are within the limit. The total real power output from PV systems at maximum value is 97,917.23 W at the case z2.

(a) Minimum and maximum phase voltage

(b) Maximum VUF

Figure 7.14 The results of the set of uncertainty

7.4.1.4 At The Day 6 November 2014

According to the set of uncertainty at the day 6 November 2014 in Table 6.10, the calculated objective value in equation (5.81) is 35,955.41 W. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.15 and they are within the limit. The total real power output from PV systems at maximum value is 99,675.54 W at the case z2.

Figure 7.15 The results of the set of uncertainty

7.4.1.5 At The Day 7 November 2014

According to the set of uncertainty at the day 7 November 2014 in Table 6.12, the calculated objective value in equation (5.81) is 38,174.22 W. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.16 and they are within the limit. The total real power output from PV systems at maximum value is 99,870.33 W at the case z2.

7.4.1.6 At The Day 8 November 2014

According to the set of uncertainty at the day 8 November 2014 in Table 6.13, the calculated objective value in equation (5.81) is 48,299.55 W. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.17 and they are within the limit. The total real power output from PV systems at maximum value is 99,839.99 W at the case z2.

7.4.1.7 At The Day 9 November 2014

According to the set of uncertainty at the day 9 November 2014 in Table 6.14, the calculated objective value in equations (5.81) is 29,586.98 W. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.18 and they are within the limit. The total real power output from PV systems at maximum value is 103,209.82 W at the case z_2 .

7.4.2 Adjustment Per One Day

In this subsection, the optimal parameters setting will be searched through 2-stage PSO. The set of uncertainty of each day will be applied. The simulation results are divided into seven subsections: (7.4.2.1) at the day 3 November 2014; (7.4.2.2) at the day 4 November 2014; (7.4.2.3) at the day 5 November 2014; (7.4.2.4) at the day 6 November 2014; (7.4.2.5) at the day 7 November 2014; (7.4.2.6) at the day 8 November

2014; (7.4.2.7) at the day 9 November 2014. The results of Subsection 7.4.2 will be compared to subsection 7.4.1.

7.4.2.1 At The Day 3 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 3 November 2014 in Table 6.8, the optimal objective value in equation (5.81) is 51,565.54 W and the results of optimal parameter setting can be shown in Table 7.7. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.19 and they are within the limit. The total real power output from PV systems at maximum value is 98,597.83 W at the case z_2 .

Table 7.7 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |

Figure 7.19 The results of the set of uncertainty

7.4.2.2 At The Day 4 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 4 November 2014 in Table 6.9, the optimal objective value in equation (5.81) is 46,719.23 W and the results of optimal parameter setting can be shown in Table 7.8. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.20 and they are within

the limit. The total real power output from PV systems at maximum value is 103,531.01 W at the case z2.

Figure 7.20 The results of the set of uncertainty

7.4.2.3 At The Day 5 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 5 November 2014 in Table 6.10, the optimal objective value in equation (5.81) is 44,143.82 W and the results of optimal parameter setting can be shown in Table 7.9. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow can be shown in Figure 7.21 and they are within the limit. The total real power output from PV systems at maximum value is 102,481.48 W at the case z_2 .

Figure 7.24 The results of the set of uncertainty

7.4.2.7 At The Day 9 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 9 November 2014 in Table 6.14, the optimal objective value in equation (5.81) is 28,240.01 W and the results of optimal parameter setting can be shown in Table 7.13. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.25 and they are within the limit. The total real power output from PV systems at maximum value is 102,564.62 W at the case z_2 .

Comparing Subsection 7.4.1 that the parameters of are adjusted in every one week and Subsection 7.4.2 that the parameters are adjusted in every one day, the summary can be shown in Table 7.14. It indicates that adjustment per one day is better than adjustment per one week. According to percent change of adjustment per one day, the objective values are better than around 3.02% and the maximum total real power outputs from PV systems at the case z2 are better than around 2.71%.

7.5 Local Control Adjustment in Every One Week or One Day Of Piecewise Linear Local Control Function

In this subsection, the comparison between (7.5.1) adjustment per one week and (7.5.2) adjustment per one day is determined for the suitable operation of coordination between central and local control. The piecewise local control function is selected in this subsection.

7.5.1 Adjustment Per One Week

In this subsection, the parameters setting in Table 7.5 is applied. The simulations are divided into 7 parts: (7.5.1.1) at the day 3 November 2014; (7.5.1.2) at the day 4 November 2014; (7.5.1.3) at the day 5 November 2014; (7.5.1.4) at the day 6 November 2014; (7.5.1.5) at the day 7 November 2014; (7.5.1.6) at the day 8 November 2014; (7.5.1.7) at the day 9 November 2014. The objective of this subsection is to determine the simulation results when (1) the set of uncertainty of each day is applied and (2) the parameters setting in Table 7.5 at the week 3-9 November 2014 is applied.

7.5.1.1 At The Day 3 November 2014

According to the set of uncertainty at the day 3 November 2014 in Table 6.8, the calculated objective value in equation (5.81) is 48,909.94 W. Considering the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.26 and they are

within the limit. The total real power output from PV systems at maximum value is 94,246.95 W at the case z2.

Figure 7.26 The results of the set of uncertainty

7.5.1.2 At The Day 4 November 2014

According to the set of uncertainty at the day 4 November 2014 in Table 6.9, the calculated objective value in equation (5.81) is 44,159.97 W. Considering the case $z \in \{z1, z2, \dots, z17\}$, the power flow results can be shown in Figure 7.27 and they are

within the limit. The total real power output from PV systems at maximum value is 99,795.17 W at the case z2.

Figure 7.27 The results of the set of uncertainty

7.5.1.3 At The Day 5 November 2014

According to the set of uncertainty at the day 5 November 2014 in Table 6.10, the calculated objective value in equation (5.81) is 40,287.06 W. Considering the case $z \in \{z1, z2, \dots, z17\}$, the power flow results can be shown in Figure 7.28 and they are

within the limit. The total real power output from PV systems at maximum value is 96,673.20 W at the case z2.

Figure 7.28 The results of the set of uncertainty

7.5.1.4 At The Day 6 November 2014

According to the set of uncertainty at the day 6 November 2014 in Table 6.11, the calculated objective value in equation (5.81) is 35,170.29 W. Considering the case $z \in \{z1, z2, \dots, z17\}$, the power flow results can be shown in Figure 7.29 and they are

within the limit. The total real power output from PV systems at maximum value is 98,521.91 W at the case z2.

Figure 7.29 The results of the set of uncertainty

7.5.1.5 At The Day 7 November 2014

According to the set of uncertainty at the day 7 November 2014 in Table 6.12, the calculated objective value in equation (5.81) is 37,402.76 W. Considering the case $z \in \{z1, z2, \dots, z17\}$, the power flow results can be shown in Figure 7.30 and they are

within the limit. The total real power output from PV systems at maximum value is 98,607.95 W at the case z2.

Figure 7.30 The results of the set of uncertainty

7.5.1.6 At The Day 8 November 2014

According to the set of uncertainty at the day 8 November 2014 in Table 6.13, the calculated objective value in equation (5.81) is 47,478.34 W. Considering the case $z \in \{z1, z2, \dots, z17\}$, the power flow results can be shown in Figure 7.31 and they are

within the limit. The total real power output from PV systems at maximum value is 98,548.21 W at the case z2.

Figure 7.31 The results of the set of uncertainty

7.5.1.7 At The Day 9 November 2014

According to the set of uncertainty at the day 9 November 2014 in Table 6.14, the calculated objective value in equation (5.81) is 28,988.39 W. Considering the case $z \in \{z1, z2, \dots, z17\}$, the power flow results can be shown in Figure 7.32 and they are

within the limit. The total real power output from PV systems at maximum value is 101,836.80 W at the case z2.

Figure 7.32 The results of the set of uncertainty

7.5.2 Adjustment Per One Day

In this subsection, the optimal parameters setting will be searched through 2-stage PSO. The set of uncertainty of each day will be applied. The simulation results are divided into seven subsections: (7.5.2.1) at the day 3 November 2014; (7.5.2.2) at

the day 4 November 2014; (7.5.2.3) at the day 5 November 2014; (7.5.2.4) at the day 6 November 2014; (7.5.2.5) at the day 7 November 2014; (7.5.2.6) at the day 8 November 2014; (7.5.2.7) at the day 9 November 2014. The results of Subsection 7.5.2 will be compared to subsection 7.5.1.

7.5.2.1 At The Day 3 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 3 November 2014 in Table 6.8, the optimal objective value in equation (5.81) is 52,107.71 W and the results of optimal parameter setting can be shown in Table 7.15. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.33 and they are within the limit. The total real power output from PV systems at maximum value is 99,253.88 W at the case z_2 .

Table 7.15 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |
|---------|-------------------|----------|-------|--------|----------|----------|

Figure 7.33 The results of the set of uncertainty

7.5.2.2 At The Day 4 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 4 November 2014 in Table 6.9, the optimal objective value in equation (5.81) is 45,218.94 W and the results of optimal parameter setting can be shown in Table 7.16. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.34 and they are within

the limit. The total real power output from PV systems at maximum value is 101,908.35 W at the case z2.

Figure 7.34 The results of the set of uncertainty

7.5.2.3 At The Day 5 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 5 November 2014 in Table 6.10, the optimal objective value in equation (5.81) is 43,312.98 W and the results of optimal parameter setting can be shown in Table 7.17. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.35 and they are within the limit. The total real power output from PV systems at maximum value is 102,267.30 W at the case z_2 .

7.5.2.4 At The Day 6 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 6 November 2014 in Table 6.11, the optimal objective value in equation (5.81) is 37,396.81 W and the results of optimal parameter setting can be shown in Table 7.18. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.36 and they are within the limit. The total real power output from PV systems at maximum value is 102,620.89 W at the case z_2 .

Figure 7.36 The results of the set of uncertainty

7.5.2.5 At The Day 7 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 7 November 2014 in Table 6.12, the optimal objective value in equation (5.81) is 39,413.84 W and the results of optimal parameter setting can be shown in Table 7.19. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.37 and they are within the limit. The total real power output from PV systems at maximum value is 102,248.17 W at the case z_2 .

Table 7.19 Parameter setting of each connected PV system

Figure 7.37 The results of the set of uncertainty

7.5.2.6 At The Day 8 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 8 November 2014 in Table 6.13, the optimal objective value in equation (5.81) is 50,026.80 W and the results of optimal parameter setting can be shown in Table 7.20. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.38 and they are within the limit. The total real power output from PV systems at maximum value is 103,326.47 W at the case z_2 .

Figure 7.38 The results of the set of uncertainty

7.5.2.7 At The Day 9 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 9 November 2014 in Table 6.14, the optimal objective value in equation (5.81) is 29,809.38 W and the results of optimal parameter setting can be shown in Table 7.21. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.39 and they are within the limit. The total real power output from PV systems at maximum value is 104,640.64 W at the case z_2 .

Figure 7.39 The results of the set of uncertainty

Comparing Subsection 7.5.1 that the parameters of are adjusted in every one week and Subsection 7.5.2 that the parameters are adjusted in every one day, the

summary can be shown in Table 7.22. It indicates that adjustment per one day is better than adjustment per one week. According to percent change of adjustment per one day, the objective values are better than around 5.19% and the maximum total real power outputs from PV systems at the case z2 are better than around 4.10%.

Table 7.22 The comparison of the parameters adjustment per one week or one day

| Day at Nov 2014 | Adjustment per one week | | Adjustment per one day | | Percent Change of Adjustment per One Day | |
|--------------------|-------------------------|--------------|------------------------|--------------|--|--------------|
| | Obj. Value | Max P Output | Obj. Value | Max P Output | Obj. Value | Max P Output |
| 3 | 48,909.94 | 94,246.95 | 52,107.71 | 99,253.88 | +6.54% | +5.31% |
| 4 | 44,159.97 | 99,795.17 | 45,218.94 | 101,908.35 | +2.40% | +2.12% |
| 5 | 40,287.06 | 96,673.2 | 43,312.98 | 102,267.3 | +7.51% | +5.79% |
| 6 | 35,170.29 | 98,521.91 | 37,396.81 | 102,620.89 | +6.33% | +4.16% |
| 7 | 37,402.76 | 98,607.95 | 39,413.84 | 102,248.17 | +5.38% | +3.69% |
| 8 | 47,478.34 | 98,548.21 | 50,026.8 | 103,326.47 | +5.37% | +4.85% |
| 9 | 28,988.39 | 101,836.8 | 29,809.38 | 104,640.64 | +2.83% | +2.75% |
| Mean Change | | | | | +5.19% | +4.10% |

Comparing the adjustment per one day strategy between Subsection 7.4.2 that local control is applied continuous function and Subsection 7.5.2 that local control is applied piecewise linear function, the percent different of objective value and maximum total real power output can be shown in Table 7.23 and it can notice that the results between Subsection 7.4.2 and Subsection 7.5.2 are close. Then, local control application can be chosen any one from continuous or piecewise linear function because of the nearly similar results.

Table 7.23 The comparison between continuous and piecewise linear local control application

| Day at Nov 2014 | Continuous Function | | Piecewise Linear Function | | Percent Change of Piecewise Linear Function | |
|-----------------|---------------------|--------------|---------------------------|--------------|---|--------------|
| | Obj. Value | Max P Output | Obj. Value | Max P Output | Obj. Value | Max P Output |
| 3 | 51,565.54 | 98,597.83 | 52,107.71 | 99,253.88 | +1.05% | +0.67% |

| Mean Change | | | | | +0.33% | +0.11% |

7.6 Local Control Adjustment in The Modified 29 Node Distribution System

In this subsection, the coordination between central and local control will apply in the modified 29 node distribution system. The simulation results are divided into 2 parts: (7.6.1) the continuous local control function application; (7.6.2) the piecewise linear local control function application.

7.6.1 The Continuous Local Control Function Application

In this subsection, the simulation results are divided into eight subsections: (7.6.1.1) at the week 3-9 November 2014; (7.6.1.2) at the day 3 November 2014; (7.6.1.3) at the day 4 November 2014; (7.6.1.4) at the day 5 November 2014; (7.6.1.5) at the day 6 November 2014; (7.6.1.6) at the day 7 November 2014; (7.6.1.7) at the day 8 November 2014; (7.6.1.8) at the day 9 November 2014. The continuous local control function is selected in this subsection.

7.6.1.1 At The Week 3-9 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the week 3 November 2014 in Table 6.7, the optimal objective value in equation (5.81) is 47,021.54 W and the results of optimal parameter setting can be shown in Table 7.24. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.40 and they are within the limit. The total real power output from PV systems at maximum value is 115,523.26 W at the case z_2 .

Table 7.24 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |

(c) MV/LV transformer utilization

(d) Maximum line capacity

Figure 7.40 The results of the set of uncertainty

Applying (1) the set of uncertainty of each day and (2) the parameters setting in Table 7.24 at the week 3-9 November 2014, the objective values and the maximum value of total real power output from PV systems at the case z2 are shown in Table 7.24. The objective values is negative in days 3-9 because the power flow results are out of limit. Mostly, loss at each day is out of the limit as shown latter in Figures 7.41-7.47. The out of limit is due to the set of uncertainty is not enough considered thoroughly in the modified 29 node distribution system. The solution can be the limit setting in the optimization constraints being less than the truth.

Table 7.25 The results of each day

| Day at Nov 2014 | Adjustment per One Week | |
|--------------------|-------------------------|--------------|
| | Obj. Value | Max P Output |
| 3 | -8.2×10^8 | 110,750.88 |
| 4 | -2.4×10^8 | 114,053.61 |
| 5 | -6.4×10^8 | 112,284.26 |
| 6 | -4.4×10^8 | 113,406.98 |
| 7 | -3.9×10^8 | 113,499.34 |
| 8 | -5.7×10^8 | 113,477.51 |
| 9 | -7.1×10^7 | 115,062.96 |

The power flow results of the set of uncertainty of each day can be shown as follows:

- At the day 3 November, the power flow results can be shown in Figure 7.41. Losses are out of limit at cases z2, z4, z6, z8, z12 and z16.

- At the day 4 November, the power flow results can be shown in Figure 7.42. Losses are out of limit at cases z2, z4, z8, z12 and z16. Overvoltages occur at cases z4 and z8. Assumingly, overvoltage is neglected because overvoltage is more than the limit slightly about less than 0.5 V.
- At the day 5 November, the power flow results can be shown in Figure 7.43. Losses are out of limit at cases z2, z4, z6, z8, z12 and z16.
- At the day 6 November, the power flow results can be shown in Figure 7.44. Losses are out of limit at cases z2, z4, z8, z12 and z16. Overvoltage occurs at case z4. Assumingly, overvoltage is neglected because overvoltage is more than the limit slightly about less than 0.5 V.
- At the day 7 November, the power flow results can be shown in Figure 7.45. Losses are out of limit at cases z2, z4, z6, z8 and z16. Overvoltage occurs at case z4. Assumingly, overvoltage is neglected because overvoltage is more than the limit slightly about less than 0.5 V.
- At the day 8 November, the power flow results can be shown in Figure 7.46. Losses are out of limit at cases z2, z4, z6, z8 and z16. Overvoltage occurs at cases z4. Assumingly, overvoltage is neglected because overvoltage is more than the limit slightly about less than 0.5 V.
- At the day 9 November, the power flow results can be shown in Figure 7.47. Losses are out of limit at cases z2 and z16. Overvoltages occur at cases z4 and z8. Assumingly, overvoltage is neglected because overvoltage is more than the limit slightly about less than 0.5 V.

7.6.1.2 At The Day 3 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 3 November 2014 in Table 6.8, the optimal objective value in equation (5.81) is 58,433.80 W and the results of optimal parameter setting can be shown in Table 7.26. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.48 and they are within the limit. The total real power output from PV systems at maximum value is 109,474.51 W at the case z_2 .

7.6.1.3 At The Day 4 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 4 November 2014 in Table 6.9, the optimal objective value in equation (5.81) is 51,862.06 W and the results of optimal parameter setting can be shown in Table 7.27. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.49 and they are within the limit. The total real power output from PV systems at maximum value is 114,606.26 W at the case z_2 .

Figure 7.53 The results of the set of uncertainty

7.6.1.8 At The Day 9 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 9 November 2014 in Table 6.14, the optimal objective value in equation (5.81) is 29,558.07 W and the results of optimal parameter setting can be shown in Table 7.32. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.54 and they are within the limit. The total real power output from PV systems at maximum value is 116,629.84 W at the case z_2 .

Figure 7.54 The results of the set of uncertainty

Comparing when the parameters of are adjusted in every one week and when the parameters are adjusted in every one day according to applying the continuous local control function, the summary can be shown in Table 7.33. It indicates that adjustment per one day is better than adjustment per one week because the parameters setting of each day can hold the limit under 17 cases of the set of uncertainty. Note that the objective value is positive because the power flow results are within the limit.

Table 7.33 The comparison between adjustment per one day and one week

| Day at Nov 2014 | Adjustment per one week | | Adjustment per one day | | Percent Change of Adjustment per One Day | |
|--------------------|-------------------------|--------------|------------------------|--------------|--|--------------|
| | Obj. Value | Max P Output | Obj. Value | Max P Output | Obj. Value | Max P Output |

7.6.2 The Piecewise Linear Local Control Function Application

In this subsection, the simulation results are divided into eight subsections: (7.6.2.1) at the week 3-9 November 2014; (7.6.2.2) at the day 3 November 2014; (7.6.2.3) at the day 4 November 2014; (7.6.2.4) at the day 5 November 2014; (7.6.2.5)

at the day 6 November 2014; (7.6.2.6) at the day 7 November 2014; (7.6.2.7) at the day 8 November 2014; (7.6.2.8) at the day 9 November 2014. The piecewise linear local control function is selected in this subsection.

7.6.2.1 At The Week 3-9 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the week 3 November 2014 in Table 6.7, the optimal objective value in equation (5.81) is 47,383.61 W and the results of optimal parameter setting can be shown in Table 7.34. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.55 and they are within the limit. The total real power output from PV systems at maximum value is 117,434.56 W at the case z_2 .

Table 7.34 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |
|---------|-------------------|----------|-------|--------|----------|----------|

(f) Total real power output from PV systems

Figure 7.55 The results of the set of uncertainty

Applying (1) the set of uncertainty of each day and (2) the parameters setting in Table 7.34 at the week 3-9 November 2014, the objective values and the maximum value of total real power output from PV systems at the case z2 are shown in Table 7.35. The objective values is negative in days 3-9 because the power flow results are out of limit. Mostly, loss at each day is out of the limit as shown latter in Figures 7.56-7.62. The out of limit is due to the set of uncertainty is not enough considered

thoroughly the uncertainty in the modified 29 node distribution system. The solution can be the limit setting in the optimization constraints being less than the truth.

Table 7.35 The results of each day

| Day at Nov 2014 | Adjustment per One Week | |
|--------------------|-------------------------|--------------|
| | Obj. Value | Max P Output |
| 3 | -1.2×10^9 | 111,162.25 |
| 4 | -5.8×10^8 | 115,518.28 |
| 5 | -1.1×10^9 | 113,433.28 |
| 6 | -8.5×10^8 | 114,697.07 |
| 7 | -8.9×10^8 | 115,009.99 |
| 8 | -9.3×10^8 | 114,925.67 |
| 9 | -1.4×10^8 | 116,929.42 |

- At the day 3 November, the power flow results can be shown in Figure 7.56. Losses are out of limit at cases z2, z4, z6, z8, z10, z12 and z16.
- At the day 4 November, the power flow results can be shown in Figure 7.57. Losses are out of limit at cases z2, z4, z6, z8, z10, z12 and z16.
- At the day 5 November, the power flow results can be shown in Figure 7.58. Losses are out of limit at cases z2, z4, z6, z8, z10, z12 and z16.
- At the day 6 November, the power flow results can be shown in Figure 7.59. Losses are out of limit at cases z2, z4, z6, z8, z10, z12 and z16.
- At the day 7 November, the power flow results can be shown in Figure 7.60. Losses are out of limit at cases z2, z4, z6, z8 and z10.
- At the day 8 November, the power flow results can be shown in Figure 7.61. Losses are out of limit at cases z2, z4, z6, z8, z10, z12 and z16.
- At the day 9 November, the power flow results can be shown in Figure 7.62. Losses are out of limit at cases z6, z8, z10, z14 and z16.

7.6.2.2 At The Day 3 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 3 November 2014 in Table 6.8, the optimal objective value in equation (5.81) is 60,022.07 W and the results of optimal parameter setting can be shown in Table 7.36. Considering only the case $z \in$

{ z_1, z_2, \dots, z_{17} }, the power flow results can be shown in Figure 7.63 and they are within the limit. The total real power output from PV systems at maximum value is 112,551.35 W at the case z_2 .

Figure 7.64 The results of the set of uncertainty

7.6.2.4 At The Day 5 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 5 November 2014 in Table 6.10, the optimal objective value in equation (5.81) is 45,003.35 W and the results of optimal parameter setting can be shown in Table 7.38. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.65 and they are within the limit. The total real power output from PV systems at maximum value is 115,153.18 W at the case z_2 .

Figure 7.65 The results of the set of uncertainty

7.6.2.5 At The Day 6 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 6 November 2014 in Table 6.11, the optimal objective value in equation (5.81) is 37,522.40 W and the results of optimal parameter setting can be shown in Table 7.39. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.66 and they are within the limit. The total real power output from PV systems at maximum value is 114,352.09 W at the case z_2 .

Figure 7.66 The results of the set of uncertainty

7.6.2.6 At The Day 7 November 2014

The parameter assessment will be analyzed by central control through 2-stage PSO process. According to the set of uncertainty at the day 7 November 2014 in Table 6.12, the optimal objective value in equation (5.81) is 41,431.62 W and the results of optimal parameter setting can be shown in Table 7.40. Considering only the case $z \in \{z_1, z_2, \dots, z_{17}\}$, the power flow results can be shown in Figure 7.67 and they are within the limit. The total real power output from PV systems at maximum value is 114,881.27 W at the case z_2 .

(a) Minimum and maximum phase voltage

(b) Maximum VUF

(c) MV/LV transformer utilization

(d) Maximum line capacity

Figure 7.69 The results of the set of uncertainty

Comparing when the parameters of are adjusted in every one week and when the parameters are adjusted in every one day according to applying the piecewise linear local control function, the summary can be shown in Table 7.43. It indicates that adjustment per one day is better than adjustment per one week because the parameters setting of each day can hold the limit under 17 cases of the set of uncertainty. Note that the objective value is positive because the power flow results are within the limit.

Table 7.43 The comparison between adjustment per one day and one week

| Day at Nov 2014 | Adjustment per one week | | Adjustment per one day | | Percent Change of Adjustment per One Day | |
|--------------------|-------------------------|--------------|------------------------|--------------|--|--------------|
| | Obj. Value | Max P Output | Obj. Value | Max P Output | Obj. Value | Max P Output |
| 3 | -1.2x10 ⁹ | 111,162.25 | 60,022.07 | 112,551.35 | >100% | +1.25% |

Comparing the adjustment per one day strategy between (1) when local control is applied continuous function and (2) when local control is applied piecewise linear function, the percent different of objective value and maximum total real power output can be shown in Table 7.23 and it can notice that the results are close between (1) when

local control is applied continuous function and (2) when local control is applied piecewise linear function. Then, local control application can be chosen any one from continuous or piecewise linear function because of the nearly similar results.

Table 7.44 The comparison between continuous and piecewise linear local control application

7.7 Monte Carlo Simulation

The optimization process applies the 17 cases of the set of uncertainty to solve the uncertainty problem. Therefore, the Monte-Carlo simulation is applied with 100,000-times random to prove the sufficiency in applying only the 17 cases of the set of uncertainty. The simulations are divided into 4 parts: (7.7.1) the modified 19 node distribution system with using continuous local control function; (7.7.2) the modified 19 node distribution system with using piecewise linear local control function; (7.7.3) The modified 29 node distribution system with using continuous local control function; (7.7.4) The modified 29 node distribution system with using piecewise linear local control function.

7.7.1 The Modified 19 Node Distribution System With Using Continuous Local Control Function

In this subsection, Monte Carlo simulation applies in eight parts: (7.7.1.1) at the week 3-9 November 2014; (7.7.1.2) at the day 3 November 2014; (7.7.1.3) at the day 4 November 2014; (7.7.1.4) at the day 5 November 2014; (7.7.1.5) at the day 6 November 2014; (7.7.1.6) at the day 7 November 2014; (7.7.1.7) at the day 8 November 2014;

(7.7.1.8) at the day 9 November 2014. The continuous local control function is selected in this subsection.

7.7.1.1 At The Week 3-9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.6 at the week 3-9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the week 3-9 November 2014 as shown in Table 7.2 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.70. The summary from Monte Carlo simulation is shown in Table 7.45. It can notice that mean values from power flow results are within the limit and. Overall results are not more than the limit specified.

(a) Minimum and maximum phase voltage

(b) Maximum VUF

(c) MV/LV transformer utilization

(d) Maximum line capacity

(e) System loss

Figure 7.70 The power flow results from 100,000-times random

Table 7.45 The results of Monte Carlo simulation

| Variables | Mean Values from 100,000 times of random | Limit | Over-limit Consideration | | |
|-------------------------|--|---------------|--------------------------|----------------------|------------|
| | | | Probability | Mean of Excess Value | Difference |
| Min Voltage | 249.83 V | 253.00 V | 0.00% | 0.00 | 0.00 |
| Max Voltage | 235.10 V | 207.00 V | 0.00% | 0.00 | 0.00 |
| Loss | 3,890.53 W | 6,547.58 W | 0.00% | 0.00 | 0.00 |
| Max VUF | 0.84 | 3.00 | 0.00% | 0.00 | 0.00 |
| Transformer Utilization | 61,021.41 VA | 125,000.00 VA | 0.00% | 0.00 | 0.00 |
| Max Line Capacity | 36.47% | 100.00% | 0.00% | 0.00 | 0.00 |

where “Mean of Excess Value” is calculated from the excess value that if no excess value from 100,000 times of random, the “Mean of Excess Value” will be zero; “Difference” is calculated from the difference between “Limit” and “Mean of Excess Value”.

7.7.1.2 At The Day 3 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.7 at the day 3 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 3 November 2014 as shown in Table 7.7 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.71. The summary from Monte Carlo simulation is shown in Table 7.46. It can notice that mean values from power flow results are within the limit. The probability of over loss is 0.02%. The mean over loss is 6,570.27 W that is slightly more than the limit around 22.69 W. Other variables have 0% probability to exceed the limits.

| Max Line Capacity | 41.54% | 100.00% | 0.00% | 0.00 | 0.00 |

7.7.1.3 At The Day 4 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.8 at the day 4 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 4 November 2014 as shown in Table 7.8 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.72. The summary from Monte Carlo simulation is shown in Table 7.47. It can notice that mean values from power flow results are within the limit. Overall results are not more than the limit specified.

7.7.1.4 At The Day 5 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.9 at the day 5 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 5 November 2014 as shown in Table 7.9 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.73. The summary from Monte Carlo simulation is shown in Table 7.48. It can notice that mean values from power flow results are within the limit. Overall results are not more than the limit specified.

7.7.1.8 At The Day 9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.13 at the day 9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 9 November 2014 as shown in Table 7.13 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.77. The summary from Monte Carlo simulation is shown in Table 7.52. It can notice that mean values from power flow results are

within the limit. The probability of over loss is 0.13%. The mean over loss is 6,570.90 W that is slightly more than the limit around 23.32 W. Other variables have 0% probability to exceed the limits.

Figure 7.77 The power flow results from 100,000-times random

Table 7.52 The results of Monte Carlo simulation

| Variables | Mean Values from 100,000 times of random | Limit | Over-limit Consideration | | |
|-------------------------|--|---------------|--------------------------|----------------------|------------|
| | | | Probability | Mean of Excess Value | Difference |
| Min Voltage | 248.13 V | 253.00V | 0.00% | 0.00 | 0.00 |
| Max Voltage | 232.65 V | 207.00 V | 0.00% | 0.00 | 0.00 |
| Loss | 2,762.98 W | 6,547.58 W | 0.13% | 6,570.90 W | 23.32 W |
| Max VUF | 1.01 | 3.00 | 0.00% | 0.00 | 0.00 |
| Transformer Utilization | 50,152.59 VA | 125,000.00 VA | 0.00% | 0.00 | 0.00 |
| Max Line Capacity | 30.83% | 100.00% | 0.00% | 0.00 | 0.00 |

From Monte Carlo simulations at the 19 node distribution system with using continuous local control function, it can prove that the determination of only the 17 cases of the set of uncertainty is sufficient to solve the uncertainty problem of load, solar irradiance and ambient temperature. It is because as follows:

- The power flow results of minimum and maximum voltage profile, maximum VUF, MV/LV transformer utilization and maximum line capacity are within the limit. The probabilities have around 100% to hold on those limits under the uncertainty;
- The probability of the loss results have 100% to hold on the limits under the uncertainty in the Day 4, 5, 6, 7 and the Week 3-9 November 2014;
- For the Day 3, 8 and 9 November 2014, the probability of the loss results to exceed the limit is less than 0.2% or the probability of the loss results have around 99.8% to hold on the loss limit under the uncertainty according to the worst case at the day 9 November 2014. Mean over losses are more than the limit about <30 W according to the day 9 November 2014.

However, the results that exceed only a small extent of the loss limit can be resolved by adjusting the loss limit in the optimization problem less than the actual value.

7.7.2 The Modified 19 Node Distribution System With Using Piecewise Linear Local Control Function

In this subsection, Monte Carlo simulation applies in eight parts: (7.7.2.1) at the week 3-9 November 2014; (7.7.2.2) at the day 3 November 2014; (7.7.2.3) at the day 4 November 2014; (7.7.2.4) at the day 5 November 2014; (7.7.2.5) at the day 6 November 2014; (7.7.2.6) at the day 7 November 2014; (7.7.2.7) at the day 8 November 2014; (7.7.2.8) at the day 9 November 2014. The piecewise linear local control function is selected in this subsection.

7.7.2.1 At The Week 3-9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.6 at the week 3-9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the week 3-9 November 2014 as shown in Table 7.5 is applied. Then, the power flow results in

7.7.2.2 At The Day 3 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.7 at the day 3 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 3 November 2014 as shown in Table 7.15 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.79. The summary from Monte Carlo simulation is shown in Table 7.54. It can notice that mean values from power flow results are within the limit. The probability of over loss is 1.74%. The mean over loss is 6,556.08 W that is slightly more than the limit around 8.50 W. Other variables have 0% probability to exceed the limits.

7.7.2.3 At The Day 4 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.8 at the day 4 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 4 November 2014 as shown in Table 7.16 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.80. The summary from Monte Carlo simulation is shown in Table 7.55. It can notice that mean values from power flow results are within the limit. Overall results are not more than the limit specified.

7.7.2.8 At The Day 9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.13 at the day 9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 9 November 2014 as shown in Table 7.21 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.85. The summary from Monte Carlo simulation is shown in Table 7.60. It can notice that mean values from power flow results are within the limit. Overall results are not more than the limit specified.

| | | | Probability | Mean of Excess Value | Difference |
| Min Voltage | 247.44 V | 253.00 V | 0.00 | 0.00 | 0.00 |
| Max Voltage | 232.41 V | 207.00 V | 0.00 | 0.00 | 0.00 |
| Loss | 3,023.57 W | 6,547.58 W | 0.00 | 0.00 | 0.00 |
| Max VUF | 0.70 | 3.00 | 0.00 | 0.00 | 0.00 |
| Transformer Utilization | 53,169.41 VA | 125,000.00 VA | 0.00 | 0.00 | 0.00 |
| Max Line Capacity | 32.00% | 100.00% | 0.00 | 0.00 | 0.00 |

From Monte Carlo simulations at the 19 node distribution system with using piecewise linear local control function, it can prove that the determination of only the 17 cases of the set of uncertainty is sufficient to solve the uncertainty problem of load, solar irradiance and ambient temperature. It is because as follows:

- The power flow results of minimum and maximum voltage profile, maximum VUF, MV/LV transformer utilization and maximum line capacity are within the limit. The probabilities have around 100% to hold on those limits under the uncertainty;
- The probability of the loss results have 100% to hold on the limits under the uncertainty in the Day 4, 5, 6, 7, 9 and the Week 3-9 November 2014;
- For the Day 3 and 8 November 2014, the probability of the loss results to exceed the limit is less than 2% or the probability of the loss results have around 98% to hold on the loss limit under the uncertainty according to the worst case at the day 8 November 2014. Mean over losses are more than the limit about <30 W according to the day 8 November 2014.

However, the results that exceed only a small extent of the loss limit can be resolved by adjusting the loss limit in the optimization problem less than the actual value.

7.7.3 The Modified 29 Node Distribution System With Using Continuous Local Control Function

In this subsection, Monte Carlo simulation applies in eight parts: (7.7.3.1) at the week 3-9 November 2014; (7.7.3.2) at the day 3 November 2014; (7.7.3.3) at the day 4 November 2014; (7.7.3.4) at the day 5 November 2014; (7.7.3.5) at the day 6 November 2014; (7.7.3.6) at the day 7 November 2014; (7.7.3.7) at the day 8 November 2014; (7.7.3.8) at the day 9 November 2014. The continuous local control function is selected in this subsection.

7.7.3.1 At The Week 3-9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.6 at the week 3-9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the week 3-9 November 2014 as shown in Table 7.24 is applied. Then, the power flow results in

7.7.3.5 At The Day 6 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.10 at the day 6 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 6 November 2014 as shown in Table 7.29 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.90. The summary from Monte Carlo simulation is shown in Table 7.65. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 0.89%. The mean over loss is 7,663.60 W that is slightly more than the limit around 21.55 W. Other variables have 0% probability to exceed the limits.

7.7.3.6 At The Day 7 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.11 at the day 7 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 7 November 2014 as shown in Table 7.30 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.91. The summary from Monte Carlo simulation is shown in Table 7.66. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 3.59%. The mean over loss is 7,681.22 W that is slightly more than the limit around 39.16 W. Other variables have 0% probability to exceed the limits.

7.7.3.7 At The Day 8 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.12 at the day 8 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 8 November 2014 as shown in Table 7.31 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.92. The summary from Monte Carlo simulation is shown in Table 7.67. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 5.58%. The mean over loss is 7,673.75 W that is slightly more than the limit around 31.70 W. Other variables have 0% probability to exceed the limits.

7.7.3.8 At The Day 9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.13 at the day 9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 9 November 2014 as shown in Table 7.32 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.93. The summary from Monte Carlo simulation is shown in Table 7.68. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 5.59%. The mean over loss is 7,729.12 W that is slightly more than the limit around 87.06 W. Other variables have 0% probability to exceed the limits.

| Variables | Mean Values from 100,000 times of random | Limit | Over-limit Consideration | | |
|-------------------------|--|---------------|--------------------------|----------------------|------------|
| | | | Probability | Mean of Excess Value | Difference |
| Min Voltage | 247.43 V | 253.00 V | 0.00% | 0.00 | 0.00 |
| Max Voltage | 237.67 V | 207.00 V | 0.00% | 0.00 | 0.00 |
| Loss | 2,973.44 W | 7,642.05 W | 5.59% | 7,729.12 W | 87.06 W |
| Max VUF | 0.75 | 3.00 | 0.00% | 0.00 | 0.00 |
| Transformer Utilization | 47,007.30 VA | 125,000.00 VA | 0.00% | 0.00 | 0.00 |
| Max Line Capacity | 22.26% | 100.00% | 0.00% | 0.00 | 0.00 |

From Monte Carlo simulations at the 29 node distribution system with using continuous local control function, it can prove that the determination of only the 17 cases of the set of uncertainty is sufficient to solve the uncertainty problem of load, solar irradiance and ambient temperature. It is because as follows:

- The power flow results of minimum and maximum voltage profile, maximum VUF, MV/LV transformer utilization and maximum line capacity are within those limit. The probabilities have around 100% to hold on the limits under the uncertainty;
- For the Day 3, 4, 5, 7 and 8 November 2014, there is a chance to occur overvoltage. Assumingly, overvoltage is neglected because overvoltage is more than the limit slightly about less than 0.5 V.
- For the Day 3, 4, 5, 6, 7, 8, 9 and the Week 3-9 November 2014, the probability of the loss results to exceed the limit is less than 30% or the probability of the loss results have around 70% to hold on the loss limit under the uncertainty according to the worst case at the week 3-9 November

2014. Mean over losses is more than the limit about <150 W according to the week 3-9 November 2014.

However, the results that exceed only a small extent of the loss limit can be resolved by adjusting the loss limit in the optimization problem less than the actual values.

7.7.4 The Modified 29 Node Distribution System With Using Piecewise Linear Local Control Function

In this subsection, Monte Carlo simulation applies in eight parts: (7.7.4.1) at the week 3-9 November 2014; (7.7.4.2) at the day 3 November 2014; (7.7.4.3) at the day 4 November 2014; (7.7.4.4) at the day 5 November 2014; (7.7.4.5) at the day 6 November 2014; (7.7.4.6) at the day 7 November 2014; (7.7.4.7) at the day 8 November 2014; (7.7.4.8) at the day 9 November 2014. The piecewise linear local control function is selected in this subsection.

7.7.4.1 At The Week 3-9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.6 at the week 3-9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the week 3-9 November 2014 as shown in Table 7.34 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.94. The summary from Monte Carlo simulation is shown in Table 7.69. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 29.60%. The mean over loss is 7,816.74 W that is slightly more than the limit around 174.68 W. Other variables have 0% probability to exceed the limits.

(a) Minimum and maximum phase voltage

(b) Maximum VUF

7.7.4.2 At The Day 3 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.7 at the day 3 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 3 November 2014 as shown in Table 7.36 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.95. The summary from Monte Carlo simulation is shown in Table

7.70. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 0.22%. The mean over loss is 7,655.99 W that is slightly more than the limit around 13.93 W. Other variables have 0% probability to exceed the limits.

7.7.4.3 At The Day 4 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.8 at the day 4 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 4 November 2014 as shown in Table 7.37 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.96. The summary from Monte Carlo simulation is shown in Table 7.71. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 10.86%. The mean over loss is 7,690.86 W that is slightly more than the limit around 48.81 W. Other variables have 0% probability to exceed the limits.

7.7.4.4 At The Day 5 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.9 at the day 5 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 5 November 2014 as shown in Table 7.38 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.97. The summary from Monte Carlo simulation is shown in Table 7.72. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 4.31%. The mean over loss is 7,663.65 W that is slightly more than the limit around 21.59 W. Other variables have 0% probability to exceed the limits.

7.7.4.5 At The Day 6 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.10 at the day 6 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 6 November 2014 as shown in Table 7.39 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.98. The summary from Monte Carlo simulation is shown in Table 7.73. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 2.92%. The mean over loss is 7,668.07 W that is slightly more than the limit around 26.01 W. Other variables have 0% probability to exceed the limits.

7.7.4.8 At The Day 9 November 2014

In this subsection, the value of load, solar irradiance and ambient temperature will be randomized in 100,000 times, according to the normal uncertainty characteristic of Figure 6.13 at the day 9 November 2014. Each random values at a time will be assessed by power flow algorithm. The optimal parameters setting at the day 9 November 2014 as shown in Table 7.42 is applied. Then, the power flow results in 100,000 times can be shown in Figure 7.101. The summary from Monte Carlo simulation is shown in Table 7.76. It can notice that mean values from power flow results are within the limit and. The probability of over loss is 7.22%. The mean over loss is 7,852.06 W that is slightly more than the limit around 210.01 W. Other variables have 0% probability to exceed the limits.

Figure 7.101 The power flow results from 100,000-times random

Table 7.76 The results of Monte Carlo simulation

| Variables | Mean Values from 100,000 times of random | Limit | Over-limit Consideration | | |
|-------------------------|--|---------------|--------------------------|----------------------|------------|
| | | | Probability | Mean of Excess Value | Difference |
| Min Voltage | 247.27 V | 253.00 V | 0.00% | 0.00 | 0.00 |
| Max Voltage | 237.96 V | 207.00 V | 0.00% | 0.00 | 0.00 |
| Loss | 2,947.57 W | 7,642.05 W | 7.22% | 7,852.06 W | 210.01 W |
| Max VUF | 0.69 | 3.00 | 0.00% | 0.00 | 0.00 |
| Transformer Utilization | 41,994.49 VA | 125,000.00 VA | 0.00% | 0.00 | 0.00 |
| Max Line Capacity | 22.08% | 100.00% | 0.00% | 0.00 | 0.00 |

From Monte Carlo simulations at the 29 node distribution system with using piecewise linear local control function, it can prove that the determination of only the 17 cases of the set of uncertainty is sufficient to solve the uncertainty problem of load, solar irradiance and ambient temperature. It is because as follows:

- The power flow results of minimum and maximum voltage profile, maximum VUF, MV/LV transformer utilization and maximum line capacity are within those limit. The probabilities have around 100% to hold on the limits under the uncertainty;
- For the Day 3, 4, 5, 6, 7, 8, 9 and the Week 3-9 November 2014, the probability of the loss results to exceed the limit is less than 40% or the probability of the loss results have around 60% to hold on the loss limit under the uncertainty according to the worst case at the day 8 November 2014. Mean over losses is more than the limit about <250 W according to the day 9 November 2014.

However, the results that exceed only a small extent of the loss limit can be resolved by adjusting the loss limit in the optimization problem less than the actual value.

From Monte Carlo simulation, it can notice that when 17 cases of the set of uncertainty is applied in a small system (such as the modified 19 node distribution system), exceeding loss limit can occur rarely. On the other hand, when 17 cases of the set of uncertainty is applied in a larger system (such as the modified 29 node distribution system), exceeding loss limit have more chance to occur. Then, adjusting loss limit in the optimization problem less than the actual value is another way to hold on the loss limit under the uncertainty in larger system.

CHAPTER 8

CONCLUSION

This chapter provides a summary of this dissertation. Then, some suggestions for improvement of this dissertation are also proposed.

8.1 Dissertation Summary

Solar energy is a clean energy and does not cause polluted environment. Then, the technology of generating electricity from solar energy has been developed such as Photovoltaic (PV) system. Currently, PV installation is supported to install in households or at LV distribution system because of the government policies and the cost reduction of PV installation. However, more PV installations in LV distribution system can bring about problems such as the followings:

- Loss of real power generation because of the operation of overvoltage protection of solar power generation systems which are specially on the downstream nodes.
- Voltage unbalance due to the connection of a single-phase PV inverter.

Generally, the aforementioned problems can be resolved by the followings [3-6]:

- Installing an MV/LV transformer with an On-Load Tap Changer (OLTC).
- Installing an energy storage system.
- Changing conductor size of LV feeder to be larger.

To support more PV installation or high PV penetration in LV distribution system, many previous researches [7-13] have studied in controlling PV system instead because it is cheaper than installing OLTC, installing energy storage system, or changing into new larger conductor. Many previous researches [7-13] have proposed 3 different concepts of the control strategies as follows:

- Central control [7, 8, 10].
- Local control [9, 11, 12].
- Coordination between central and local control [13].

CD :Thesis 5671437221 dissertation / rev: 24072562 19:37:03 / seq: 6

This dissertation notices the advantages of the control strategy of coordination between central and local control that has no need of very reliable communication system with central control and, moreover, the parameter setting of local control can be optimally updated to suit at any periods. However, the previous researches [7-13] did not determine the uncertainty of load and solar irradiance which the uncertainty can cause the voltage problem in LV distribution system. Then, the uncertainty is the important topic which is determined in this dissertation.

The optimization process of the coordination between central and local control of this dissertation applies 2-stage PSO to find the optimal parameter setting of local control. The 2-stage PSO is used to solve the disadvantage of ordinary PSO process which is not suitable for solving optimization problem with many free variables. The local control applies $P(U)$ and $Q(U)$ functions to adjust real and reactive power output which are generated by connected PV system when the voltage at the connection point changes. The power flow algorithm applies Newton-Raphson Method with step-length adjustment. Moreover, the 17 cases of the set of uncertainty are presented to take care of the uncertainty of load, solar irradiance and ambient temperature that can be occurred. The resetting of the parameter of local control can be in every day or week. The optimization problem is determined on maximization of total real power output from PV systems on the mean value from the normal uncertainty characteristic. The normal uncertainty characteristic is assessed from the collected data which is consisted of load, solar, and ambient temperature. Note that the mean value has the highest chance to occur according to normal uncertainty characteristic. From the results in Section 7, they can be summarized as follows.

Firstly, the coordination between central and local control strategy can support high PV penetration in LV distribution system. The parameters adjustment can be one day or week.

Secondly, local control should be coordinated between $P(U)$ and $Q(U)$ functions for more injection of real power from connected PV systems. Any continuous or piecewise linear function can be chosen to operate because of the close results.

Thirdly, the different parameters setting of each PV system is better than the same setting according to the comparison between the different and same parameter settings.

CU Theses 5671437221 dissertation / recv: 24072562 19:37:03 / seq: 6

Fourthly, the resetting of local control in every day is preferred because of better objective value result than resetting in every week.

Fifthly, Monte-Carlo simulation with 100,000-times random is applied to determine the sufficiency of the determination of only the 17 cases of the set of uncertainty in the optimization problem. It can find as follows:

- In a small system such as the modified 19 node distribution system, the results can hold on the limit effectively. However, exceeding loss limit has about <2% chance.
- In a larger system such as the modified 29 node distribution system, the results have more chance to exceed the loss limit about <40%.
- Other values (the minimum and maximum voltage, VUF, line flow, MV/LV transformer utilization) are absolutely within the limit in small or larger system.

To handle loss within the limit, adjusting limit in the optimization problem less than the actual value is a another solution.

8.2 Recommendation for future research development

Some development and improvement of this dissertation are presented as follows:

- Energy Storage System (ESS) can help support high PV penetration in LV distribution system. Then, the future researches should include ESS installation.
- This dissertation can resets the parameter setting of local control in every day or week. The future researches should reset in faster period by modifying the optimization process to find the faster solution.
- Develop uncertainty analysis in optimization problem to reduce over loss limit probability.

APPENDIX A

Positive-sequence Current Calculation

The derivation of positive-sequence current calculation in equation (2.6) can be initiated from equation (A.1) to equation (A.7).

$$S^{ABC} = [V^{ABC}]^T \times [I^{ABC}]^* \quad (\text{A.1})$$

$$S^{ABC} = [A_s V^{012}]^T \times [A_s I^{012}]^* \quad ; \quad A_s = \begin{bmatrix} 1 & 1 & 1 \\ 1 & a^2 & a \\ 1 & a & a^2 \end{bmatrix} \quad (\text{A.2})$$

$$S^{ABC} = [V^{012}]^T \times A_s^T \times A_s^* \times [I^{012}]^* \quad ; \quad A_s^T \times A_s^* = 3 \quad (\text{A.3})$$

$$S^{ABC} = 3 \times \begin{bmatrix} V^{ze} \\ V^{po} \\ V^{ne} \end{bmatrix}^T \times \begin{bmatrix} I^{ze} \\ I^{po} \\ I^{ne} \end{bmatrix}^* \quad (\text{A.4})$$

Three phase PV inverter does not generate zero and negative sequence current. Then, $I^{ze} = I^{ne} = 0$.

$$S^{ABC} = 3 \times V^{po} \times [I^{po}]^* \quad ; \quad S^{ABC} = P_{pv} + jQ_{pv} \quad (\text{A.5})$$

$$\frac{1}{3}(P_{pv} + jQ_{pv}) = (V^{po,r} + jV^{po,m})(I^{po,r} + jI^{po,m})^* \quad (\text{A.6})$$

From (A.6), it can transform into matrix equation (A.7) that is the equation (2.6) for calculating positive-sequence current.

$$\begin{bmatrix} I^{po,r} \\ I^{po,m} \end{bmatrix} = \frac{1}{3} \times \begin{bmatrix} V^{po,r} & V^{po,m} \\ V^{po,m} & -V^{po,r} \end{bmatrix}^{-1} \times \begin{bmatrix} P_{pv} \\ Q_{pv} \end{bmatrix} \quad (\text{A.7})$$

APPENDIX B

Differential Equation of Three-Phase PV system

B.1 Differential Equation by Voltage and Phase Angle

Normally, power output of three-phase PV system can be written into Table

B.1.

Table B.1 Power output of three-phase PV system

| | |
|----------------------------|---|
| $P_{i,pv}^A + jQ_{i,pv}^A$ | $= V_i^A \angle \delta_i^A \cdot [I_i^{po,r} - jI_i^{po,m}]$ $= [V_i^A \cos(\delta_i^A) + jV_i^A \sin(\delta_i^A)] \cdot [I_i^{po,r} - jI_i^{po,m}]$ $= V_i^A I_i^{po,r} \cos(\delta_i^A) + V_i^A I_i^{po,m} \sin(\delta_i^A)$ $\quad + j[V_i^A I_i^{po,r} \sin(\delta_i^A) - V_i^A I_i^{po,m} \cos(\delta_i^A)]$ |
| $P_{i,pv}^B + jQ_{i,pv}^B$ | $= V_i^B \angle (\delta_i^B + 120^\circ) \cdot [I_i^{po,r} - jI_i^{po,m}]$ $= [V_i^B \cos(\delta_i^B + 120^\circ) + jV_i^B \sin(\delta_i^B + 120^\circ)] \cdot [I_i^{po,r} - jI_i^{po,m}]$ $= V_i^B I_i^{po,r} \cos(\delta_i^B + 120^\circ) + V_i^B I_i^{po,m} \sin(\delta_i^B + 120^\circ)$ $\quad + j[V_i^B I_i^{po,r} \sin(\delta_i^B + 120^\circ)$ $\quad - V_i^B I_i^{po,m} \cos(\delta_i^B + 120^\circ)]$ |
| $P_{i,pv}^C + jQ_{i,pv}^C$ | $= V_i^C \angle (\delta_i^C - 120^\circ) \cdot [I_i^{po,r} - jI_i^{po,m}]$ $= [V_i^C \cos(\delta_i^C - 120^\circ) + jV_i^C \sin(\delta_i^C - 120^\circ)] \cdot [I_i^{po,r} - jI_i^{po,m}]$ $= V_i^C I_i^{po,r} \cos(\delta_i^C - 120^\circ) + V_i^C I_i^{po,m} \sin(\delta_i^C - 120^\circ)$ $\quad + j[V_i^C I_i^{po,r} \sin(\delta_i^C - 120^\circ)$ $\quad - V_i^C I_i^{po,m} \cos(\delta_i^C - 120^\circ)]$ |

From equation (A.7), $I_i^{po,r}$ and $I_i^{po,m}$ can be written into equations (B.1) and (B.2).

$$I_i^{po,r} = \frac{1}{3} \left[\frac{V_i^{po,r} P_{i,pv} + V_i^{po,m} Q_{i,pv}}{V_i^{rm}} \right] \quad (B.1)$$

$$I_i^{po,m} = \frac{1}{3} \left[\frac{V_i^{po,m} P_{i,pv} - V_i^{po,r} Q_{i,pv}}{V_i^{rm}} \right] \quad (B.2)$$

$$V_i^{po,r} = \frac{1}{3} [V_i^A \cos(\delta_i^A) + V_i^B \cos(\delta_i^B + 120^\circ) + V_i^C \cos(\delta_i^C - 120^\circ)] \quad (\text{B.3})$$

$$V_i^{po,m} = \frac{1}{3} [V_i^A \sin(\delta_i^A) + V_i^B \sin(\delta_i^B + 120^\circ) + V_i^C \sin(\delta_i^C - 120^\circ)] \quad (\text{B.4})$$

$$\begin{aligned} V_i^{rm} = \frac{1}{9} [& V_i^{A^2} + V_i^{B^2} + V_i^{C^2} + 2V_i^A V_i^B \cos(\delta_i^A - \delta_i^B - 120^\circ) \\ & + 2V_i^A V_i^C \cos(\delta_i^A - \delta_i^C + 120^\circ) \\ & + 2V_i^B V_i^C \cos(\delta_i^B - \delta_i^C + 240^\circ)] \end{aligned} \quad (\text{B.5})$$

The differential of phase-A real power can be written into equations (B.6)-(B.11).

$$\begin{aligned} \frac{\partial P_{i,pv}^A}{\partial V_i^A} = V_i^A \left[\cos(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial V_i^A} + \sin(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial V_i^A} \right] \\ + [I_i^{po,r} \cos(\delta_i^A) + I_i^{po,m} \sin(\delta_i^A)] \end{aligned} \quad (\text{B.6})$$

$$\frac{\partial P_{i,pv}^A}{\partial V_i^B} = V_i^A \left[\cos(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial V_i^B} + \sin(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial V_i^B} \right] \quad (\text{B.7})$$

$$\frac{\partial P_{i,pv}^A}{\partial V_i^C} = V_i^A \left[\cos(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial V_i^C} + \sin(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial V_i^C} \right] \quad (\text{B.8})$$

$$\begin{aligned} \frac{\partial P_{i,pv}^A}{\partial \delta_i^A} = V_i^A \left[-\sin(\delta_i^A) I_i^{po,r} + \cos(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial \delta_i^A} + \cos(\delta_i^A) I_i^{po,m} \right. \\ \left. + \sin(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial \delta_i^A} \right] \end{aligned} \quad (\text{B.9})$$

$$\frac{\partial P_{i,pv}^A}{\partial \delta_i^B} = V_i^A \left[\cos(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial \delta_i^B} + \sin(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial \delta_i^B} \right] \quad (\text{B.10})$$

$$\frac{\partial P_{i,pv}^A}{\partial \delta_i^C} = V_i^A \left[\cos(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial \delta_i^C} + \sin(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial \delta_i^C} \right] \quad (\text{B.11})$$

The differential of phase-B real power can be written into equations (B.12)-(B.17).

$$\frac{\partial P_{i,pv}^B}{\partial V_i^A} = V_i^B \left[\cos(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,r}}{\partial V_i^A} + \sin(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,m}}{\partial V_i^A} \right] \quad (\text{B.12})$$

$$\begin{aligned} \frac{\partial P_{i,pv}^B}{\partial V_i^B} = V_i^B \left[\cos(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,r}}{\partial V_i^B} + \sin(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,m}}{\partial V_i^B} \right] \\ + [I_i^{po,r} \cos(\delta_i^B + 120^\circ) + I_i^{po,m} \sin(\delta_i^B + 120^\circ)] \end{aligned} \quad (\text{B.13})$$

$$\frac{\partial P_{i,pv}^B}{\partial V_i^C} = V_i^B \left[\cos(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,r}}{\partial V_i^C} + \sin(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,m}}{\partial V_i^C} \right] \quad (B.14)$$

$$\frac{\partial P_{i,pv}^B}{\partial \delta_i^A} = V_i^B \left[\cos(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,r}}{\partial \delta_i^A} + \sin(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,m}}{\partial \delta_i^A} \right] \quad (B.15)$$

$$\begin{aligned} \frac{\partial P_{i,pv}^B}{\partial \delta_i^B} = V_i^B \left[-\sin(\delta_i^B + 120^\circ) I_i^{po,r} + \cos(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,r}}{\partial \delta_i^B} \right. \\ \left. + \cos(\delta_i^B + 120^\circ) I_i^{po,m} + \sin(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,m}}{\partial \delta_i^B} \right] \end{aligned} \quad (B.16)$$

$$\frac{\partial P_{i,pv}^B}{\partial \delta_i^C} = V_i^B \left[\cos(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,r}}{\partial \delta_i^C} + \sin(\delta_i^B + 120^\circ) \frac{\partial I_i^{po,m}}{\partial \delta_i^C} \right] \quad (B.17)$$

The differential of phase-C real power can be written into equations (B.18)-
(B.23).

$$\frac{\partial P_{i,pv}^C}{\partial V_i^A} = V_i^C \left[\cos(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,r}}{\partial V_i^A} + \sin(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,m}}{\partial V_i^A} \right] \quad (B.18)$$

$$\frac{\partial P_{i,pv}^C}{\partial V_i^B} = V_i^C \left[\cos(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,r}}{\partial V_i^B} + \sin(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,m}}{\partial V_i^B} \right] \quad (B.19)$$

$$\begin{aligned} \frac{\partial P_{i,pv}^C}{\partial V_i^C} = V_i^C \left[\cos(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,r}}{\partial V_i^C} + \sin(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,m}}{\partial V_i^C} \right] \\ + [I_i^{po,r} \cos(\delta_i^C - 120^\circ) + I_i^{po,m} \sin(\delta_i^C - 120^\circ)] \end{aligned} \quad (B.20)$$

$$\frac{\partial P_{i,pv}^C}{\partial \delta_i^A} = V_i^C \left[\cos(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,r}}{\partial \delta_i^A} + \sin(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,m}}{\partial \delta_i^A} \right] \quad (B.21)$$

$$\frac{\partial P_{i,pv}^C}{\partial \delta_i^B} = V_i^C \left[\cos(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,r}}{\partial \delta_i^B} + \sin(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,m}}{\partial \delta_i^B} \right] \quad (B.22)$$

$$\begin{aligned} \frac{\partial P_{i,pv}^C}{\partial \delta_i^C} = V_i^C \left[-\sin(\delta_i^C - 120^\circ) I_i^{po,r} + \cos(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,r}}{\partial \delta_i^C} \right. \\ \left. + \cos(\delta_i^C - 120^\circ) I_i^{po,m} + \sin(\delta_i^C - 120^\circ) \frac{\partial I_i^{po,m}}{\partial \delta_i^C} \right] \end{aligned} \quad (B.23)$$

The differential of phase-A reactive power can be written into equations (B.24)-
(B.29).

$$\begin{aligned} \frac{\partial Q_{i,pv}^A}{\partial V_i^A} = V_i^A \left[\sin(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial V_i^A} - \cos(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial V_i^A} \right] \\ + [I_i^{po,r} \sin(\delta_i^A) - I_i^{po,m} \cos(\delta_i^A)] \end{aligned} \quad (B.24)$$

$$\frac{\partial Q_{i,pv}^A}{\partial V_i^B} = V_i^A \left[\sin(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial V_i^B} - \cos(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial V_i^B} \right] \quad (B.25)$$

$$\frac{\partial Q_{i,pv}^A}{\partial V_i^C} = V_i^A \left[\sin(\delta_i^A) \frac{\partial I_i^{po,r}}{\partial V_i^C} - \cos(\delta_i^A) \frac{\partial I_i^{po,m}}{\partial V_i^C} \right] \quad (B.26)$$

APPENDIX C

The Calculation Example Of The Power Flow Algorithm With Using Local Control Function

The modified 19 node LV distribution system, that is described in Subsection 6.1, is applied. Phase-A, -B and -C loads are 0.3124, 0.2599 and 0.2928 pu. respectively. Solar irradiance is 0.3519 kW/m². Ambient temperature is 30.10 °C. The continuous local control function is selected to operate. PV1-PV18 have the same parameters setting: $V_{cri} = 1.062$; $\delta_p = 0.01$; $K_1 = 0.06$; $K_2 = 1.06$; $V_q = 1.021$; $\delta_q = 0.01$. The process of power flow algorithm is as follows.

First: For load buses, where $P_{i,load}^{sch}$ and $Q_{i,load}^{sch}$ are specified, voltage magnitudes and phase angles are set equal to the slack bus values. Initial voltage is 1.05 pu. Initial phase angles (A, B, C) are (0, -2.0944, 2.0944) radians.

Second: For step-change values, $w_{V_i^\sigma}^{(h0)} = w_{\delta_i^\sigma}^{(h0)} = 1$.

Third: For load buses, $P_{i,load}^{\sigma(k0)} \begin{Bmatrix} V_i^{\sigma(k0)} \\ \delta_i^{\sigma(k0)} \end{Bmatrix}$ and $Q_{i,load}^{\sigma(k0)} \begin{Bmatrix} V_i^{\sigma(k0)} \\ \delta_i^{\sigma(k0)} \end{Bmatrix}$ are calculated from equations (5.1), (5.2), (5.16), (5.17), (5.30) and (5.31) as shown Table C.1. $\Delta P_{i,load}^{\sigma(k0)}$ and $\Delta Q_{i,load}^{\sigma(k0)}$ are calculated from equations (5.40) and (5.41) as shown in Table C.1.

Table C.1 The calculated values

| Node | | $P_{i,load}^{\sigma(k0)}$ | $Q_{i,load}^{\sigma(k0)}$ | $\Delta P_{i,load}^{\sigma(k0)}$ | $\Delta Q_{i,load}^{\sigma(k0)}$ |

Fourth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.8)-(5.15), (5.18)-(5.29) and (5.32)-(5.39).

Fifth: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k0)}$ and $\Delta|V_i^{\sigma(k0)}|$ are obtained as shown Table C.2.

Sixth: For load buses, $P_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k0)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k0)}| \\ \delta_i^{\sigma(k0)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k0)} \end{array} \right\}$ and

$Q_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k0)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k0)}| \\ \delta_i^{\sigma(k0)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k0)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.2. $\Delta P_{i,load}^{\sigma(h0)}$ and $\Delta Q_{i,load}^{\sigma(h0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.2.

Table C.2 The calculated values

| Node | $\Delta V_i^{(k0)} $ | $\Delta \delta_i^{(k0)}$ | $P_{i,load}^{(h0)}$ | $Q_{i,load}^{(h0)}$ | $\Delta P_{i,load}^{(h0)}$ | $\Delta Q_{i,load}^{(h0)}$ | |

Seventh: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Eighth: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h0)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ are obtained as shown in Table C.3.

Ninth: The new step-length values $\left\{ \begin{matrix} w_{V_i^{\sigma}}^{(h1)} = w_{V_i^{\sigma}}^{(h0)} + \Delta w_{V_i^{\sigma}}^{(h0)} \\ w_{\delta_i^{\sigma}}^{(h1)} = w_{\delta_i^{\sigma}}^{(h0)} + \Delta w_{\delta_i^{\sigma}}^{(h0)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.3.

Table C.3 The calculated values

| Node | | $\Delta w_{V_i^{\sigma}}^{(h0)}$ | $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ | $w_{V_i^{\sigma}}^{(h1)}$ | $w_{\delta_i^{\sigma}}^{(h1)}$ |

Tenth: For load buses, $P_{i,load}^\sigma{}^{(h1)} \left\{ \begin{array}{l} V_i^\sigma{}^{(k0)} + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma{}^{(k0)}| \\ \delta_i^\sigma{}^{(k0)} + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma{}^{(k0)} \end{array} \right\}$ and

$Q_{i,load}^\sigma{}^{(h1)} \left\{ \begin{array}{l} V_i^\sigma{}^{(k0)} + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma{}^{(k0)}| \\ \delta_i^\sigma{}^{(k0)} + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma{}^{(k0)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.4. $\Delta P_{i,load}^\sigma{}^{(h1)}$ and $\Delta Q_{i,load}^\sigma{}^{(h1)}$ are calculated from equations (5.40) and (5.41) as shown Table C.4.

Table C.4 The calculated values

Eleventh: Determine $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 0.0196$ and $\max\{|\Delta P_{i,load}^{\sigma (h0)}|, |\Delta Q_{i,load}^{\sigma (h0)}|\} = 0.0201$. After that, go to the next calculation.

Twelfth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Thirteenth: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^\sigma}^{(h1)}$ and $\Delta w_{\delta_i^\sigma}^{(h1)}$ are obtained as shown in Table C.5.

Fourteenth: The new step-length values $\left\{ \begin{matrix} w_{V_i^\sigma}^{(h2)} = w_{V_i^\sigma}^{(h1)} + \Delta w_{V_i^\sigma}^{(h1)} \\ w_{\delta_i^\sigma}^{(h2)} = w_{\delta_i^\sigma}^{(h1)} + \Delta w_{\delta_i^\sigma}^{(h1)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.5.

Table C.5 The calculated values

Fifteenth: For load buses, $P_{i,load}^\sigma (h2) \left\{ \begin{array}{l} V_i^\sigma (k0) + w_{V_i^\sigma}^{(h2)} \cdot \Delta |V_i^\sigma (k0)| \\ \delta_i^\sigma (k0) + w_{\delta_i^\sigma}^{(h2)} \cdot \Delta \delta_i^\sigma (k0) \end{array} \right\}$ and

$Q_{i,load}^\sigma (h2) \left\{ \begin{array}{l} V_i^\sigma (k0) + w_{V_i^\sigma}^{(h2)} \cdot \Delta |V_i^\sigma (k0)| \\ \delta_i^\sigma (k0) + w_{\delta_i^\sigma}^{(h2)} \cdot \Delta \delta_i^\sigma (k0) \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.6. $\Delta P_{i,load}^\sigma (h2)$ and $\Delta Q_{i,load}^\sigma (h2)$ are calculated from equations (5.40) and (5.41) as shown Table C.6.

Table C.6 The calculated values

Sixteenth: Determine $\max\{|\Delta P_{i,load}^{\sigma (h2)}|, |\Delta Q_{i,load}^{\sigma (h2)}|\} = 0.0228$ and $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 0.0196$. Then, update voltage magnitudes, $|V_i^{\sigma (k1)}| = |V_i^{\sigma (k0)}| + w_{V_i^{\sigma (h1)}} \cdot \Delta |V_i^{\sigma (k0)}|$, and phase angles, $\delta_i^{\sigma (k1)} = \delta_i^{\sigma (k0)} + w_{\delta_i^{\sigma (h1)}} \cdot \Delta \delta_i^{\sigma (k0)}$, by $w_{V_i^{\sigma (h1)}}$ and $w_{\delta_i^{\sigma (h1)}}$ at equations (5.42) and (5.43) as shown in Table C.7. After that, renew $w_{V_i^{\sigma (h0)}} = w_{\delta_i^{\sigma (h0)}} = 0.9$ and go to **STEP 3** of the power flow algorithm.

Eighteenth: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k1)}$ and $\Delta|V_i^{\sigma(k1)}|$ are obtained as shown Table C.9.

Nineteenth: For load buses, $P_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k1)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k1)}| \\ \delta_i^{\sigma(k1)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k1)} \end{array} \right\}$ and $Q_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k1)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k1)}| \\ \delta_i^{\sigma(k1)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k1)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.9. $\Delta P_{i,load}^{\sigma(h0)}$ and $\Delta Q_{i,load}^{\sigma(h0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.9.

Twentieth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Twenty-first: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h0)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ are obtained as shown in Table C.10.

Twenty-second: The new step-length values $\left\{ \begin{matrix} w_{V_i^\sigma}^{(h1)} = w_{V_i^\sigma}^{(h0)} + \Delta w_{V_i^\sigma}^{(h0)} \\ w_{\delta_i^\sigma}^{(h1)} = w_{\delta_i^\sigma}^{(h0)} + \Delta w_{\delta_i^\sigma}^{(h0)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.10.

Table C.10 The calculated values

| Node | | $\Delta w_{V_i^\sigma}^{(h0)}$ | $\Delta w_{\delta_i^\sigma}^{(h0)}$ | $w_{V_i^\sigma}^{(h1)}$ | $w_{\delta_i^\sigma}^{(h1)}$ |

Twenty-third: For load buses, $P_{i,load}^\sigma$ $\left\{ \begin{matrix} V_i^\sigma(k1) + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma(k1)| \\ \delta_i^\sigma(k1) + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma(k1) \end{matrix} \right\}$ and

$Q_{i,load}^\sigma$ $\left\{ \begin{matrix} V_i^\sigma(k1) + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma(k1)| \\ \delta_i^\sigma(k1) + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma(k1) \end{matrix} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.11. $\Delta P_{i,load}^\sigma$ $^{(h1)}$ and $\Delta Q_{i,load}^\sigma$ $^{(h1)}$ are calculated from equations (5.40) and (5.41) as shown Table C.11.

Table C.11 The calculated values

Twenty-fourth: Determine $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 0.0191$ and $\max\{|\Delta P_{i,load}^{\sigma (h0)}|, |\Delta Q_{i,load}^{\sigma (h0)}|\} = 0.0205$. After that, go to the next calculation.

Twenty-fifth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Twenty-sixth: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma (h1)}}$ and $\Delta w_{\delta_i^{\sigma (h1)}}$ are obtained as shown in Table C.12.

Twenty-seventh: The new step-length values $\left. \begin{matrix} w_{V_i^{\sigma (h2)}} = w_{V_i^{\sigma (h1)}} + \Delta w_{V_i^{\sigma (h1)}} \\ w_{\delta_i^{\sigma (h2)}} = w_{\delta_i^{\sigma (h1)}} + \Delta w_{\delta_i^{\sigma (h1)}} \end{matrix} \right\}$ are computed

from equations (5.79) and (5.80) as shown in Table C.12.

Twenty-ninth: Determine $\max\{|\Delta P_{i,load}^{\sigma (h2)}|, |\Delta Q_{i,load}^{\sigma (h2)}|\} = 0.0237$ and $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 0.0191$. Then, update voltage magnitudes, $|V_i^{\sigma (k2)}| = |V_i^{\sigma (k1)}| + w_{V_i^{\sigma (h1)}} \cdot \Delta |V_i^{\sigma (k1)}|$, and phase angles, $\delta_i^{\sigma (k2)} = \delta_i^{\sigma (k1)} + w_{\delta_i^{\sigma (h1)}} \cdot \Delta \delta_i^{\sigma (k1)}$, by $w_{V_i^{\sigma (h1)}}$ and $w_{\delta_i^{\sigma (h1)}}$ at equations (5.42) and (5.43) as shown in Table C.14. After that, renew $w_{V_i^{\sigma (h0)}} = w_{V_i^{\sigma (h0)}} = 0.8$ and go to **STEP 3** of the power flow algorithm.

Thirty-first: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k2)}$ and $|\Delta V_i^{\sigma(k2)}|$ are obtained as shown Table C.16.

Thirty-second: For load buses, $P_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k2)} + w_{V_i^{\sigma}}^{(h0)} \cdot |\Delta V_i^{\sigma(k2)}| \\ \delta_i^{\sigma(k2)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k2)} \end{array} \right\}$ and $Q_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k2)} + w_{V_i^{\sigma}}^{(h0)} \cdot |\Delta V_i^{\sigma(k2)}| \\ \delta_i^{\sigma(k2)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k2)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56), (5.69) and (5.70) as shown in Table C.16. $\Delta P_{i,load}^{\sigma(h0)}$ and $\Delta Q_{i,load}^{\sigma(h0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.16.

Thirty-third: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Thirty-fourth: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h0)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ are obtained as shown in Table C.17.

Thirty-fifth: The new step-length values $\left\{ \begin{array}{l} w_{V_i^{\sigma}}^{(h1)} = w_{V_i^{\sigma}}^{(h0)} + \Delta w_{V_i^{\sigma}}^{(h0)} \\ w_{\delta_i^{\sigma}}^{(h1)} = w_{\delta_i^{\sigma}}^{(h0)} + \Delta w_{\delta_i^{\sigma}}^{(h0)} \end{array} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.17.

Table C.17 The calculated values

| Node | | $\Delta w_{V_i^{\sigma}}^{(h0)}$ | $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ | $w_{V_i^{\sigma}}^{(h1)}$ | $w_{\delta_i^{\sigma}}^{(h1)}$ |

Thirty-sixth: For load buses,
$$P_{i,load}^{\sigma (h1)} \left\{ \begin{array}{l} V_i^{\sigma (k2)} + w_{V_i^{\sigma}}^{(h1)} \cdot \Delta |V_i^{\sigma (k2)}| \\ \delta_i^{\sigma (k2)} + w_{\delta_i^{\sigma}}^{(h1)} \cdot \Delta \delta_i^{\sigma (k2)} \end{array} \right\} \text{ and}$$

$$Q_{i,load}^{\sigma (h1)} \left\{ \begin{array}{l} V_i^{\sigma (k2)} + w_{V_i^{\sigma}}^{(h1)} \cdot \Delta |V_i^{\sigma (k2)}| \\ \delta_i^{\sigma (k2)} + w_{\delta_i^{\sigma}}^{(h1)} \cdot \Delta \delta_i^{\sigma (k2)} \end{array} \right\}$$

are calculated from equations (5.44), (5.45), (5.55), (5.56), (5.69) and (5.70) as shown in Table C.18. $\Delta P_{i,load}^{\sigma (h1)}$ and $\Delta Q_{i,load}^{\sigma (h1)}$ are calculated from equations (5.40) and (5.41) as shown Table C.18.

Table C.18 The calculated values

Thirty-seventh: Determine $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 0.0216$ and $\max\{|\Delta P_{i,load}^{\sigma (h0)}|, |\Delta Q_{i,load}^{\sigma (h0)}|\} = 0.0189$. Then, update voltage magnitudes, $|V_i^{\sigma (k3)}| = |V_i^{\sigma (k2)}| + w_{V_i^{\sigma (h0)}} \cdot \Delta |V_i^{\sigma (k2)}|$, and phase angles, $\delta_i^{\sigma (k3)} = \delta_i^{\sigma (k2)} + w_{\delta_i^{\sigma (h0)}} \cdot \Delta \delta_i^{\sigma (k2)}$, by $w_{V_i^{\sigma (h0)}}$ and $w_{\delta_i^{\sigma (h0)}}$ at equations (5.42) and (5.43) as shown in Table C.19. After that, renew $w_{V_i^{\sigma (h0)}} = w_{V_i^{\sigma (h0)}} = 0.7$ and go to **STEP 3** of the power flow algorithm.

Thirty-ninth: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k3)}$ and $\Delta|V_i^{\sigma(k3)}|$ are obtained as shown Table C.21.

Fortieth: For load buses, $P_{i,load}^{\sigma(h0)} \left\{ \begin{matrix} V_i^{\sigma(k3)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k3)}| \\ \delta_i^{\sigma(k3)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k3)} \end{matrix} \right\}$ and $Q_{i,load}^{\sigma(h0)} \left\{ \begin{matrix} V_i^{\sigma(k3)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k3)}| \\ \delta_i^{\sigma(k3)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k3)} \end{matrix} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56), (5.69) and (5.70) as shown in Table C.21. $\Delta P_{i,load}^{\sigma(h0)}$ and $\Delta Q_{i,load}^{\sigma(h0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.21.

Table C.21 The calculated values

Forty-first: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Forty-second: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h0)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ are obtained as shown in Table C.22.

Forty-third: The new step-length values $\left\{ \begin{matrix} w_{V_i^{\sigma}}^{(h1)} = w_{V_i^{\sigma}}^{(h0)} + \Delta w_{V_i^{\sigma}}^{(h0)} \\ w_{\delta_i^{\sigma}}^{(h1)} = w_{\delta_i^{\sigma}}^{(h0)} + \Delta w_{\delta_i^{\sigma}}^{(h0)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.22.

Table C.22 The calculated values

Forty-fourth: For load buses, $P_{i,load}^\sigma (h1) \left\{ \begin{array}{l} V_i^{\sigma(k3)} + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^{\sigma(k3)}| \\ \delta_i^{\sigma(k3)} + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^{\sigma(k3)} \end{array} \right\}$ and

$Q_{i,load}^\sigma (h1) \left\{ \begin{array}{l} V_i^{\sigma(k3)} + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^{\sigma(k3)}| \\ \delta_i^{\sigma(k3)} + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^{\sigma(k3)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.23. $\Delta P_{i,load}^{\sigma (h1)}$ and $\Delta Q_{i,load}^{\sigma (h1)}$ are calculated from equations (5.40) and (5.41) as shown Table C.23.

Forty-fifth: Determine $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 0.0228$ and $\max\{|\Delta P_{i,load}^{\sigma (h0)}|, |\Delta Q_{i,load}^{\sigma (h0)}|\} = 0.0167$. Then, update voltage magnitudes, $|V_i^{\sigma (k4)}| = |V_i^{\sigma (k3)}| + w_{V_i^{\sigma (h0)}} \cdot \Delta |V_i^{\sigma (k3)}|$, and phase angles, $\delta_i^{\sigma (k4)} = \delta_i^{\sigma (k3)} + w_{\delta_i^{\sigma (h0)}} \cdot \Delta \delta_i^{\sigma (k3)}$, by $w_{V_i^{\sigma (h0)}}$ and $w_{\delta_i^{\sigma (h0)}}$ at equations (5.42) and (5.43) as shown in Table C.24. After that, renew $w_{V_i^{\sigma (h0)}} = w_{V_i^{\sigma (h0)}} = 0.6$ and go to **STEP 3** of the power flow algorithm.

Forty-seventh: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k4)}$ and $\Delta|V_i^{\sigma(k4)}|$ are obtained as shown Table C.26.

Forty-eighth: For load buses, $P_{i,load}^{\sigma (h0)} \left\{ \begin{matrix} V_i^{\sigma (k4)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta |V_i^{\sigma (k4)}| \\ \delta_i^{\sigma (k4)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta \delta_i^{\sigma (k4)} \end{matrix} \right\}$ and

$Q_{i,load}^{\sigma (h0)} \left\{ \begin{matrix} V_i^{\sigma (k4)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta |V_i^{\sigma (k4)}| \\ \delta_i^{\sigma (k4)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta \delta_i^{\sigma (k4)} \end{matrix} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.26. $\Delta P_{i,load}^{\sigma (h0)}$ and $\Delta Q_{i,load}^{\sigma (h0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.26.

Table C.26 The calculated values

| Node | $\Delta V_i^{\sigma (k4)} $ | $\Delta \delta_i^{\sigma (k4)}$ | $P_{i,load}^{\sigma (h0)}$ | $Q_{i,load}^{\sigma (h0)}$ | $\Delta P_{i,load}^{\sigma (h0)}$ | $\Delta Q_{i,load}^{\sigma (h0)}$ | |

Forty-ninth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Fifty-first: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^\sigma}^{(h0)}$ and $\Delta w_{\delta_i^\sigma}^{(h0)}$ are obtained as shown in Table C.27.

Fifty-second: The new step-length values $\left\{ \begin{matrix} w_{V_i^\sigma}^{(h1)} = w_{V_i^\sigma}^{(h0)} + \Delta w_{V_i^\sigma}^{(h0)} \\ w_{\delta_i^\sigma}^{(h1)} = w_{\delta_i^\sigma}^{(h0)} + \Delta w_{\delta_i^\sigma}^{(h0)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.27.

Table C.27 The calculated values

Fifty-third: For load buses, $P_{i,load}^\sigma$ $^{(h1)} \left\{ \begin{array}{l} V_i^\sigma(k4) + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma(k4)| \\ \delta_i^\sigma(k4) + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma(k4) \end{array} \right\}$ and

$$Q_{i,load}^\sigma$$
 $^{(h1)} \left\{ \begin{array}{l} V_i^\sigma(k4) + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma(k4)| \\ \delta_i^\sigma(k4) + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma(k4) \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.28. $\Delta P_{i,load}^\sigma$ $^{(h1)}$ and $\Delta Q_{i,load}^\sigma$ $^{(h1)}$ are calculated from equations (5.40) and (5.41) as shown Table C.28.

Table C.28 The calculated values

Fifty-fourth: Determine $\max\{|\Delta P_{i,load}^{\sigma(h1)}|, |\Delta Q_{i,load}^{\sigma(h1)}|\} = 0.0252$ and $\max\{|\Delta P_{i,load}^{\sigma(h0)}|, |\Delta Q_{i,load}^{\sigma(h0)}|\} = 0.0135$. Then, update voltage magnitudes, $|V_i^{\sigma(k5)}| = |V_i^{\sigma(k4)}| + w_{V_i^{\sigma(h0)}} \cdot \Delta |V_i^{\sigma(k4)}|$, and phase angles, $\delta_i^{\sigma(k5)} = \delta_i^{\sigma(k4)} + w_{\delta_i^{\sigma(h0)}} \cdot \Delta \delta_i^{\sigma(k4)}$, by $w_{V_i^{\sigma(h0)}}$ and $w_{\delta_i^{\sigma(h0)}}$ at equations (5.42) and (5.43) as shown in Table C.29. After that, renew $w_{V_i^{\sigma(h0)}} = w_{V_i^{\sigma(h0)}} = 0.5$ and go to **STEP 3** of the power flow algorithm.

Fifty-sixth: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k5)}$ and $\Delta|V_i^{\sigma(k5)}|$ are obtained as shown Table C.31.

Fifty-seventh: For load buses, $P_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k5)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k5)}| \\ \delta_i^{\sigma(k5)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k5)} \end{array} \right\}$ and $Q_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k5)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k5)}| \\ \delta_i^{\sigma(k5)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k5)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.31. $\Delta P_{i,load}^{\sigma(h_0)}$ and $\Delta Q_{i,load}^{\sigma(h_0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.31.

Table C.31 The calculated values

Fifty-eighth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Fifty-ninth: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h0)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ are obtained as shown in Table C.32.

Sixtieth: The new step-length values $\left\{ \begin{matrix} w_{V_i^{\sigma}}^{(h1)} = w_{V_i^{\sigma}}^{(h0)} + \Delta w_{V_i^{\sigma}}^{(h0)} \\ w_{\delta_i^{\sigma}}^{(h1)} = w_{\delta_i^{\sigma}}^{(h0)} + \Delta w_{\delta_i^{\sigma}}^{(h0)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.32.

Sixty-second: Determine $\max\{|\Delta P_{i,load}^{\sigma(h1)}|, |\Delta Q_{i,load}^{\sigma(h1)}|\} = 0.0211$ and $\max\{|\Delta P_{i,load}^{\sigma(h0)}|, |\Delta Q_{i,load}^{\sigma(h0)}|\} = 0.0130$. Then, update voltage magnitudes, $|V_i^{\sigma(k6)}| = |V_i^{\sigma(k5)}| + w_{V_i^{\sigma(h0)}} \cdot \Delta|V_i^{\sigma(k5)}|$, and phase angles, $\delta_i^{\sigma(k6)} = \delta_i^{\sigma(k5)} + w_{\delta_i^{\sigma(h0)}} \cdot \Delta\delta_i^{\sigma(k5)}$, by $w_{V_i^{\sigma(h0)}}$ and $w_{\delta_i^{\sigma(h0)}}$ at equations (5.42) and (5.43) as shown in Table C.34. After that, renew $w_{V_i^{\sigma(h0)}} = w_{V_i^{\sigma(h0)}} = 0.4$ and go to **STEP 3** of the power flow algorithm.

Sixty-fourth: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k6)}$ and $\Delta|V_i^{\sigma(k6)}|$ are obtained as shown Table C.36.

Sixty-fifth: For load buses, $P_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k6)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k6)}| \\ \delta_i^{\sigma(k6)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k6)} \end{array} \right\}$ and $Q_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k6)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k6)}| \\ \delta_i^{\sigma(k6)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k6)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.36. $\Delta P_{i,load}^{\sigma(h0)}$ and $\Delta Q_{i,load}^{\sigma(h0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.36.

Sixty-sixth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Sixty-seventh: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h0)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ are obtained as shown in Table C.37.

Sixty-eighth: The new step-length values $\left\{ \begin{array}{l} w_{V_i^{\sigma}}^{(h1)} = w_{V_i^{\sigma}}^{(h0)} + \Delta w_{V_i^{\sigma}}^{(h0)} \\ w_{\delta_i^{\sigma}}^{(h1)} = w_{\delta_i^{\sigma}}^{(h0)} + \Delta w_{\delta_i^{\sigma}}^{(h0)} \end{array} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.37.

Table C.37 The calculated values

| Node | $\Delta w_{V_i^{\sigma}}^{(h0)}$ | $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ | $w_{V_i^{\sigma}}^{(h1)}$ | $w_{\delta_i^{\sigma}}^{(h1)}$ | |

Seventieth: Determine $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 0.0197$ and $\max\{|\Delta P_{i,load}^{\sigma (h0)}|, |\Delta Q_{i,load}^{\sigma (h0)}|\} = 0.0100$. Then, update voltage magnitudes, $|V_i^{\sigma (k7)}| = |V_i^{\sigma (k6)}| + w_{V_i^{\sigma (h0)}} \cdot \Delta |V_i^{\sigma (k6)}|$, and phase angles, $\delta_i^{\sigma (k7)} = \delta_i^{\sigma (k6)} + w_{\delta_i^{\sigma (h0)}} \cdot \Delta \delta_i^{\sigma (k6)}$, by $w_{V_i^{\sigma (h0)}}$ and $w_{\delta_i^{\sigma (h0)}}$ at equations (5.42) and (5.43) as shown in Table C.39. After that, renew $w_{V_i^{\sigma (h0)}} = w_{V_i^{\sigma (h0)}} = 0.3$ and go to **STEP 3** of the power flow algorithm.

Table C.39 The updated values

Seventy-First: For load buses, $P_{i,load}^{\sigma(k7)} \left\{ V_i^{\sigma(k7)} \right\}$ and $Q_{i,load}^{\sigma(k7)} \left\{ V_i^{\sigma(k7)} \right\}$ are calculated from equations (5.1), (5.2), (5.16), (5.17), (5.30) and (5.31) as shown Table C.35. $\Delta P_{i,load}^{\sigma(k7)}$ and $\Delta Q_{i,load}^{\sigma(k7)}$ are calculated from equations (5.40) and (5.41) as shown Table C.40.

Table C.40 The calculated values

Seventy-second: The linear simultaneous equation (5.7) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta\delta_i^{\sigma(k7)}$ and $\Delta|V_i^{\sigma(k7)}|$ are obtained as shown Table C.41.

Seventy-third: For load buses, $P_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k7)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k7)}| \\ \delta_i^{\sigma(k7)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k7)} \end{array} \right\}$ and $Q_{i,load}^{\sigma(h0)} \left\{ \begin{array}{l} V_i^{\sigma(k7)} + w_{V_i^{\sigma}}^{(h0)} \cdot \Delta|V_i^{\sigma(k7)}| \\ \delta_i^{\sigma(k7)} + w_{\delta_i^{\sigma}}^{(h0)} \cdot \Delta\delta_i^{\sigma(k7)} \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56), (5.69) and (5.70) as shown in Table C.41. $\Delta P_{i,load}^{\sigma(h0)}$ and $\Delta Q_{i,load}^{\sigma(h0)}$ are calculated from equations (5.40) and (5.41) as shown Table C.41.

Table C.41 The calculated values

| Node | | $\Delta V_i^{\sigma(k7)} $ | $\Delta\delta_i^{\sigma(k7)}$ | $P_{i,load}^{\sigma(h0)}$ | $Q_{i,load}^{\sigma(h0)}$ | $\Delta P_{i,load}^{\sigma(h0)}$ | $\Delta Q_{i,load}^{\sigma(h0)}$ |

Seventy-fourth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Seventy-fifth: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h0)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h0)}$ are obtained as shown in Table C.42.

Seventy-sixth: The new step-length values $\left. \begin{matrix} w_{V_i^\sigma}^{(h1)} = w_{V_i^\sigma}^{(h0)} + \Delta w_{V_i^\sigma}^{(h0)} \\ w_{\delta_i^\sigma}^{(h1)} = w_{\delta_i^\sigma}^{(h0)} + \Delta w_{\delta_i^\sigma}^{(h0)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.42.

Table C.42 The calculated values

Seventy-seventh: For load buses, $P_{i,load}^\sigma (h1) \left\{ \begin{array}{l} V_i^\sigma (k7) + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma (k7)| \\ \delta_i^\sigma (k7) + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma (k7) \end{array} \right\}$ and

$Q_{i,load}^\sigma (h1) \left\{ \begin{array}{l} V_i^\sigma (k7) + w_{V_i^\sigma}^{(h1)} \cdot \Delta |V_i^\sigma (k7)| \\ \delta_i^\sigma (k7) + w_{\delta_i^\sigma}^{(h1)} \cdot \Delta \delta_i^\sigma (k7) \end{array} \right\}$ are calculated from equations (5.44), (5.45), (5.55), (5.56),

(5.69) and (5.70) as shown in Table C.43. $\Delta P_{i,load}^\sigma (h1)$ and $\Delta Q_{i,load}^\sigma (h1)$ are calculated from equations (5.40) and (5.41) as shown Table C.43.

Table C.43 The calculated values

Seventy-eighth: Determine $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 5.6619 \times 10^{-4}$ and $\max\{|\Delta P_{i,load}^{\sigma (h0)}|, |\Delta Q_{i,load}^{\sigma (h0)}|\} = 0.0070$. After that, go to the next calculation.

Seventy-ninth: The elements of the Jacobian matrix (J_1, J_2, J_3 and J_4) are calculated from equations (5.47)-(5.54), (5.57)-(5.68) and (5.71)-(5.78).

Eightieth: The linear simultaneous equation (5.46) is solved directly by optimally ordered triangular factorization and Gaussian elimination. The $\Delta w_{V_i^{\sigma}}^{(h1)}$ and $\Delta w_{\delta_i^{\sigma}}^{(h1)}$ are obtained as shown in Table C.44.

Eighty-first: The new step-length values $\left. \begin{matrix} w_{V_i^{\sigma}}^{(h2)} = w_{V_i^{\sigma}}^{(h1)} + \Delta w_{V_i^{\sigma}}^{(h1)} \\ w_{\delta_i^{\sigma}}^{(h2)} = w_{\delta_i^{\sigma}}^{(h1)} + \Delta w_{\delta_i^{\sigma}}^{(h1)} \end{matrix} \right\}$ are computed from

equations (5.79) and (5.80) as shown in Table C.44.

Eighty-third: Determine $\max\{|\Delta P_{i,load}^{\sigma (h2)}|, |\Delta Q_{i,load}^{\sigma (h2)}|\} = 1.1827 \times 10^{-5}$ and $\max\{|\Delta P_{i,load}^{\sigma (h1)}|, |\Delta Q_{i,load}^{\sigma (h1)}|\} = 5.6619 \times 10^{-4}$. It is noticed that $\max\{|\Delta P_{i,load}^{\sigma (h2)}|, |\Delta Q_{i,load}^{\sigma (h2)}|\} < \varepsilon$. Then, the power flow algorithm is terminated and the new voltage magnitudes, $|V_i^{\sigma (k8)}| = |V_i^{\sigma (k7)}| + w_{V_i^{\sigma (h2)}} \cdot \Delta |V_i^{\sigma (k7)}|$, and phase angles, $\delta_i^{\sigma (k8)} = \delta_i^{\sigma (k7)} + w_{\delta_i^{\sigma (h2)}} \cdot \Delta \delta_i^{\sigma (k7)}$, are computed from equations (5.42) and (5.43) by $w_{V_i^{\sigma (h2)}}$ and $w_{\delta_i^{\sigma (h2)}}$ as shown in Table C.46.

Eighty-fourth: For cross check, $P_{i,load}^{\sigma(k8)} \begin{Bmatrix} V_i^{\sigma(k8)} \\ \delta_i^{\sigma(k8)} \end{Bmatrix}$ and $Q_{i,load}^{\sigma(k8)} \begin{Bmatrix} V_i^{\sigma(k8)} \\ \delta_i^{\sigma(k8)} \end{Bmatrix}$ are calculated

from equations (5.1), (5.2), (5.16), (5.17), (5.30) and (5.31) as shown Table C.47. $\Delta P_{i,load}^{\sigma(k8)}$ and $\Delta Q_{i,load}^{\sigma(k8)}$ are calculated from equations (5.38) and (5.39) as shown Table C.47. $\max\{|\Delta P_i^{\sigma(k8)}|, |\Delta Q_i^{\sigma(k8)}|\} = 1.1827 \times 10^{-5}$. Then, the power flow algorithm is convergent.

Table C.47 The calculated values

APPENDIX D

The Optimization Problem Based On Only Severe Case Consideration Under The Uncertainty

Following the optimization problem based on only severe case consideration under the uncertainty, the optimization problem from equations (5.81)-(5.86) can be transformed to the following:

$$\text{maximize} \left[\sum_i^n \sum_{\sigma \in \{A,B,C\}} P_{i,pv,z16}^\sigma \right] \quad (D.1)$$

Subject to:

$$V_{min}^\sigma \leq V_{i,z16}^\sigma \leq V_{max}^\sigma \quad (D.2)$$

$$|I_{i-j,z16}^\sigma| \leq I_{i-j,max}^\sigma \quad (D.3)$$

$$|S_{z16}^{MV/LV}| \leq S_{max}^{MV/LV} \quad (D.4)$$

$$VUF_{i,z16} \leq 3\% ; VUF_i = \frac{|V_i^{ne}|}{|V_i^{po}|} \times 100\% \quad (D.5)$$

$$P_{loss,z16} \leq Loss_{max\ load, no\ PV} \quad (D.6)$$

The optimization problem (D.1) and also the constraints (D.2)-(D.6) determine only severe case or case z16. This case z16 is determined on the minimum load and maximum solar irradiance condition. To test this optimization problem (D.1), the configuration is defined as follows:

- Test on the modified 19 node distribution system;
- Determine the set of uncertainty at the week 3-9 November 2014;
- The continuous local control function is selected to operate.

When the 2-stage PSO is applied, the optimal parameters setting can be shown in Table D.1. The objective value from equation (D.1) is 88,412.86 W.

Table D.1 Parameter setting of each connected PV system

| PV Name | Parameter Setting | | | | | |
|---------|-------------------|------------|-------|-------|-------|------------|
| | V_{crit} | δ_p | K_1 | K_2 | V_q | δ_q |
| PV1 | 1.1 | 0.01 | 0.836 | 1.512 | 1.034 | 0.078 |
| PV2 | 1.1 | 0.01 | 0.868 | 1.55 | 1.024 | 0.095 |
| PV3 | 1.101 | 0.01 | 0.819 | 1.492 | 1.025 | 0.096 |
| PV4 | 1.09 | 0.01 | 0.613 | 0.668 | 1.017 | 0.094 |
| PV5 | 1.096 | 0.01 | 0.843 | 1.499 | 1.026 | 0.096 |
| PV6 | 1.098 | 0.01 | 0.926 | 1.504 | 1.029 | 0.091 |
| PV7 | 1.107 | 0.01 | 0.875 | 1.606 | 1.022 | 0.092 |
| PV8 | 1.11 | 0.01 | 0.883 | 1.528 | 1.016 | 0.098 |
| PV9 | 1.091 | 0.01 | 0.785 | 1.488 | 1.024 | 0.092 |
| PV10 | 1.092 | 0.01 | 0.827 | 1.501 | 1.027 | 0.099 |
| PV11 | 1.098 | 0.01 | 0.842 | 1.517 | 1.035 | 0.097 |
| PV12 | 1.093 | 0.01 | 0.866 | 1.528 | 1.033 | 0.096 |
| PV13 | 1.106 | 0.01 | 0.816 | 1.492 | 1.023 | 0.095 |
| PV14 | 1.095 | 0.01 | 0.811 | 1.512 | 1.024 | 0.096 |
| PV15 | 1.098 | 0.01 | 0.835 | 1.529 | 1.024 | 0.1 |
| PV16 | 1.1 | 0.01 | 0.793 | 1.497 | 1.024 | 0.095 |
| PV17 | 1.106 | 0.01 | 0.789 | 1.488 | 1.024 | 0.095 |
| PV18 | 1.095 | 0.01 | 0.878 | 1.505 | 1.025 | 0.092 |

Apply the parameters setting in Table D.1, the power flow results of total 17 cases of the set of uncertainty can be shown in Figure D.1.

(a) Minimum and maximum phase voltage

(b) Maximum VUF

(c) MV/LV transformer utilization

(d) Maximum line capacity

(e) System loss

Figure D.1 The results of the set of uncertainty

From Figure D.1, it can notice that:

- Voltage and loss at the case z16 is within the limit. Surely, it is because only case z16 is determined on optimization problem under the constraint;
- Cases on the minimum solar irradiance condition are within the limit. They are consisted of z3, z5, z7, z9, z11, z13, z15 and z17;
- Case z1 on the mean load and mean solar irradiance condition is luckily within the limit;
- Case z2 on the maximum load and maximum solar irradiance condition is luckily within the voltage limit but out of the maximum loss limit;
- Other cases (z4, z6, z8, z10, z12 and z14) with the maximum solar irradiance condition are out of the voltage and loss limit.

Therefore, it can conclude that the optimization problem based on only severe case consideration under the uncertainty cannot hold on the power flow results within limit under the uncertainty.

APPENDIX E

The Contrast Optimization Problems

In the past proposal, the optimization problem is presented as shown in equation (D.1) to solve the maximization of total real power output from overall PV systems as shown in equation (D.2) and minimization of system loss as shown in equation (D.3) simultaneously. The equation (D.3) can transform to the maximization problem as shown in equation (D.4). When the equations (D.2) and (D.4) are sum together, the equation (D.1) is obtained.

$$\text{maximize} \left[\sum_i^n \sum_{\sigma \in \{A,B,C\}} P_{i,pv,z1}^\sigma \right] - P_{loss,z1} \quad (E.1)$$

$$\text{maximize} \left[\sum_i^n \sum_{\sigma \in \{A,B,C\}} P_{i,pv,z1}^\sigma \right] \quad (E.2)$$

$$\text{minimize} [P_{loss,z1}] \quad (E.3)$$

$$\text{maximize} [-P_{loss,z1}] \quad (E.4)$$

According to the formulation of optimization problem in equation (D.1), it is incorrect because the equation (D.2) contrasts with the equation (D.3). To express this problem clearly, Multi-Objective Particle Swarm Optimization (MOPSO) [47] will be applied to solve the optimization problems (D.5) and (D.6). For the equation (D.5), it is obtained from the transformed equation (D.2) by changing into the minimization problem. The constraints of equations (D.5) and (D.6) are the system limit as shown in equations (D.7)-(D.10).

$$fob1 = \text{minimize} \left[- \sum_i^n \sum_{\sigma \in \{A,B,C\}} P_{i,pv,z1}^\sigma \right] \quad (E.5)$$

$$fob2 = \text{minimize} [P_{loss,z1}] \quad (E.6)$$

$$V_{min}^\sigma \leq V_{i,z}^\sigma \leq V_{max}^\sigma \quad (E.7)$$

$$|I_{i-j,z}^\sigma| \leq I_{i-j,max}^\sigma \quad (E.8)$$

$$|S_z^{M^V/L^V}| \leq S_{max}^{M^V/L^V} \quad (E.9)$$

$$VUF_{i,z} \leq 3\% ; VUF_i = \frac{|V_i^{ne}|}{|V_i^{po}|} \times 100\% \quad (E.10)$$

where $z \in \{z1, z2, \dots, z17\}$.

The results from MOPSO can be shown in Figure D.1. It can notice that:

- At the point A of Figure D.1 ($fob1 = -49,969.87, fob2 = 5,943.88$), it indicates that when $fob1$ is obtained at minimum value but the value of $fob2$ is obtained at non-minimum. Similarly, when the parameter is set to inject more real power output, more loss is occurred.
- At the point B of Figure D.1 ($fob1 = -10,581.05, fob2 = 501.70$), it indicates that when $fob2$ is obtained at minimum value but the value of $fob1$ is obtained at non-minimum. Similarly, when the parameter is set to inject less real power output, loss is occurred at the small value.

Then, it can be noticed that the equations (D.2) and (D.3) are conflict together and cannot sum directly, as shown in equation (D.1), to solve both the objectives (D.2) and (D.3).

Figure E.1 The results from MOPSO

The results of MOPSO in Figure D.1 is determined on the same parameter setting of continuous local control function of each connected PV system. At the point A, $\{V_{i,cri}, \delta_{i,p}, K_{i,1}, K_{i,2}, V_{i,q}, \delta_{i,q}\}$ is $\{1.062, 0.01, 0.06, 1.06, 1.021, 0.01\}$. At the point B, $\{V_{i,cri}, \delta_{i,p}, K_{i,1}, K_{i,2}, V_{i,q}, \delta_{i,q}\}$ is $\{1.039, 0.01, 0.295, 0.949, 1.053, 0.01\}$.

APPENDIX F

The Study Of The Maximum High PV Penetration Under No Local Control

In this Appendix, the study is based on the modified 19 and 29 node distribution system. The study will determine only sever case or minimum load condition. According to the set of uncertainty of the week 3-9 November 2014, the minimum load of phase A, B and C are 0.1135, 0.1007 and 0.1815 respectively. Every connected 1-phase PV system is defined to have the same size.

F.1 The Modified 19 Node Distribution System

The study determines in 3 parts as follows.

- Firstly, every load point of each phase has a 1-phase PV system. Increasing size of 1-phase PV systems until the simulation results nearly exceed the limit, the high PV penetration result is 52% of transformer capacity. The size of each 1-phase PV system is around 1.2 kW. The voltage profile of 52% high PV penetration can be shown in Figure F.1.

Figure F.1 The voltage profile result

- Secondly, only downstream node 18 and 19 of each phase has 1-phase PV system. Node 18 and 19 are the downstream node of each branch of the modified 19 node distribution system. Increasing size of 1-phase PV systems until the simulation results nearly exceed the limit, the high PV

penetration result is 34% of transformer capacity. The size of each 1-phase PV system is around 7 kW. The voltage profile of 34% high PV penetration can be shown in Figure F.2.

Figure F.2 The voltage profile result

- Finally, only one downstream node 19 of each phase has 1-phase PV system. Increasing size of 1-phase PV systems until the simulation results nearly exceed the limit, the high PV penetration result is 25% of transformer capacity. The size of each 1-phase PV system is around 10 kW. The voltage profile of 25% high PV penetration can be shown in Figure F.3.

Figure F.3 The voltage profile result

F.2 The Modified 29 Node Distribution System

The study determines in 3 parts as follows.

- Firstly, every load point of each phase has a 1-phase PV system. Increasing size of 1-phase PV systems until the simulation results nearly exceed the limit, the high PV penetration result is 53% of transformer

capacity. The size of each 1-phase PV system is around 1.1 kW. The voltage profile of 53% high PV penetration can be shown in Figure F.1.

Figure F.4 The voltage profile result

- Secondly, only downstream node 10, 16 and 29 of each phase has 1-phase PV system. There are 3 branches of the modified 29 node distribution system and node 10, 16 and 29 are the downstream node of each branch. Increasing size of 1-phase PV systems until the simulation results nearly exceed the limit, the high PV penetration result is 44% of transformer capacity. The size of each 1-phase PV system is around 6.1 kW. The voltage profile of 44% high PV penetration can be shown in Figure F.5.

Figure F.5 The voltage profile result

- Finally, only downstream node 29 of each phase has 1-phase PV system. Note that node 29 is the farthest node of the modified 29 node distribution system. Increasing size of 1-phase PV systems until the simulation results nearly exceed the limit, the high PV penetration result is 22% of transformer

capacity. The size of each 1-phase PV system is around 9.1 kW. The voltage profile of 22% high PV penetration can be shown in Figure F.6.

Figure F.6 The voltage profile result

From the high PV penetration results of both Subsection F.1 and F.2 according to no embed local control, it can conclude that:

- Each LV distribution system has a different level of high PV penetration;
- Distributed PV system connection has higher level of high PV penetration than clustered PV system connection.

APPENDIX G

Load, Solar Irradiance and Ambient Temperature Data

The collected data in 3-9 November 2014 between 6.00-18.00 O'clock can be shown in Table 1.

Table G.1 The collected data in 3-9 November 2014 between 6.00-18.00 O'clock

| Date | Time | Load (pu.) | | | Solar (kW/m ²) | Ambient Temp. (°C) | Date | Time | Load (pu.) | | | Solar (kW/m ²) | Ambient Temp. (°C) |
